ABSTRACT

In the present time Natural products are considered to be symbols of protection in comparison to the synthetic product that are regarded as unsafe to human life and environment. Although a large number of synthetic drugs are being added to the world of present pharmacopoeia, but still no system of medicine in the world has been able to solve all the health problems, which include diseases like Cancer. Plant-derived compounds have played an important role in the development of several clinically useful anti-cancer agents. These include vinblastine, vincristine, the camptothecin derivatives, topotecan and irinotecan, etoposide, derived from epipodophyllotoxin, and paclitaxel (taxol). Several promising new agents are in clinical development based on selective activity against cancer-related molecular targets, including flavopiridol and combretastatin A4 phosphate, and some agents which failed in earlier clinical studies are stimulating renewed interest. Therefore the search for innovative therapeutic constituents from plants is genuine and urgent. In India, there is an ocean of knowledge about medicinal plants and rich medicinal flora, but still only a few pearls have been searched as therapeutic agents.

Key words: Cancer, Anti-cancer agents, Natural Plant

1. INTRODUCTION

Plants have a long history of use in the treatment of cancer. Hartwell, in his review of plants used against cancer, lists more than 3000 plant species that have reportedly been used in the treatment of cancer. The word “Cancer” was coined by a Greek physician Hippocrates (460 - 370 BC), who is further more well thought-of as the “Father of Medicine”. Hippocrates used the terms “carcino” and “carcinoma” to describe non-ulcer forming and ulcer-forming tumors. Galen (130-200 AD), another Roman physician, used the word oncos’ (Greek for swelling) to describe tumors. A mature human comprises about 1015 cells; scores of them divide and differentiate in order to renew organs and tissues, which require cell turnover ¹.

Cancer is one of the most common devastating disease affecting millions of people per year. Cancer has been estimated as the second leading cause of death in humans. So there has been an intense search on various biological sources to develop a novel anti-cancer drug to combat this disease. Plants have proved to be an important natural source of anti-cancer therapy for several years. About 30 plant derived compounds have been isolated so far and are currently under clinical trials. These anti-cancer compounds have been found to be clinically active against various types of cancer cells.
Among the causes for cancer are tobacco, viral infection, chemicals, radiation, environmental factors, and dietary factors [1]. Ontogenesis is regulators of cellular communication with the outside environment. They are derived through the mutation of proto-oncogene. Mutated oncogenes are stimulated by exposure to chemical, environment or viral carcinogens, which leads to cell changes and they produce proteins which are either wrongly expressed within their normal cell or expressed in inappropriate tissue which leads to cellular proliferation and there by result in cancer formation. Tumor suppressor genes are intended to keep oncogenes in check by halting uncontrolled cellular growth. In direct opposition to oncogenes, which induce cancer when stimulated or amplified, tumor suppressor genes promote cancer when inactivated or attenuated. Two of the most prevalent tumor suppressor genes involved in the generation of cancer is p53 and retinoblastoma or Rb [4]. Cancer is a term that is used to refer to a number of conditions where the body's cells begin to grow and reproduce in an uncontrollable way. This rapid growth of cancerous cells is known as a malignant tumour. These cells can then invade and destroy healthy tissue, including organs [5,6]. Cancer sometimes begins in one part of the body before spreading to other parts. This process is known as metastasis.

![Diagram of cell regulation and deregulation mechanism](image)

**Figure 1.** Cancer cell regulation and deregulation mechanism.
1.1. How common is cancer?

Cancer is a common condition and is a serious health problem, both in the UK and across the world. It is estimated that 7.6 million people in the world died of cancer in 2007. In the UK, cancer is responsible for 126,000 deaths per year. One in four people die from cancer.\(^7\)

1.2. Anti-cancerous drugs under clinical trials

There are four major structural classifications of plant-derived anticancerous compounds viz., Vinca alkaloids, Epipodophyllotoxin lignans, Taxane diterpenoids and Camptothecin quinolone alkaloid derivatives. Different anti-cancer compounds that have been identified and reported by scientists have been reviewed under.\(^9\)

1.3. Types of cancer

There are hundreds of different types of cancer. The most common cancers in the UK are: Breast cancer, Prostate cancer, Lung cancer, Cancer of colon or rectum, Blood cancer, Bladder cancer, ovarian cancer etc. Risk factors for cancer include smoking, drinking alcohol, obesity, poor diet, lack of exercise, and prolonged exposure to sunlight.

1.4. Treatments of Cancer

Treatments of cancer include Surgery, Chemotherapy and Radiotherapy. Some cancers can be cured if detected early enough.\(^9\)

1.5. Plant-Derived Anti-Cancer Agents in Clinical Use.\(^10\)

Natural products have anti-cancerous potential due to the occurrence of natural antioxidants carrying out as reducing agents, free radical scavengers and quenchers of singlet oxygen. Greater part of their antioxidant action is due to bioactive compounds viz. flavones, isoflavones, flavonoids, anthocyanins, coumarins, lignans, catechins and isocatechins as well natural products can reduce or minimize the toxic side effect of chemotherapy and radiation treatment by reinforcing their cancer killing action. Significant assistance has been made by They worked out the cytotoxic activity of medicinal plants and studied their anti-proliferative activity against cancer. In the present time natural products are considered to be symbols of protection in comparison to the synthetic product that are regarded as unsafe to human life and environment that is by natural products had been priced for their medicinal importance.\(^5\)

1.5.1. Vinca alkaloids

Vinca alkaloids belong to an important class of anti-cancer drugs. The mechanism of action of Vinca alkaloids is that they inhibit the cell proliferation by affecting the microtubular dynamics during mitosis, and this causes a characteristic block during mitosis leading to apoptosis. Certain semi-synthetic analogues have been developed to increase the therapeutic index. Vinblastine (VLB) and Vincristine (VCR) are the two major naturally occurring active compounds obtained from the Madagascar periwinkle, Catharanthus roseus G. Don. (Apocynaceae). These compounds reported potential activity against lymphocytic leukemia in mice. Vinorelbine(VRLB) and Vindesine (VDS) are the two semisynthetic analogs obtained from the active compounds. They showed potential activity against leukemia’s, lymphomas, advanced testicular cancer, breast cancer, lung cancer and Kaposi’s sarcoma when treated in combination with other chemotherapeutic drugs.\(^11\) Vinca alkaloids are most commonly administered weekly by short IV injection (1–15min), more rarely by continuous infusion. Vinorelbine is the sole alkaid available orally and it is administered as a single dose weekly.\(^12\) Vinorelbine is used for the treatment of non-small cell lung cancer and metastatic breast cancer. The main toxic effect of vinorelbine is granulocytopenia with only modest thrombocytopenia and less neurotoxicity than other vinca alkaloids.\(^13\)

Vinflunine has been used in the treatment of bladder, non-small cell lung and breast cancers; its main side effects are myelosuppression and constipation which are apparently more manageable compared to the other vinca alkaloids.\(^14\)

1.5.2. Podophyllotoxin

Podophyllotoxin is obtained from the roots of Podophyllum species, namely, Podophyllum peltatum Linnaeus and Podophyllum emodi Wallich. This was isolated in 1880s, and their structure was elucidated in 1950s. Epipodophyllotoxin is an isomer of podophyllotoxin. The two clinically important semisynthetic analogs generated from Epipodophyllotoxin are Etoposide and Teniposide which were found very potential in treating lymphomas, bronchial and testicular cancers.\(^15\) Podophyllotoxin, an active principle of podophyllin, is used in the treatment of Hodgkin’s disease, non-Hodgkin’s lymphoma, leukaemia, and cancers of the ovary.\(^16\)

1.5.3. Taxanes

Paclitaxel (Taxol®) is obtained from the bark of the Pacific Yew, Taxus brevifolia Nutt. (Taxaceae). Their structure was first identified in the year 1971 and they entered the market since 1990s. Another species, Taxus baccata, an Indian Ayurvedic medicine have also been in use for cancer therapy.\(^17\) Paclitaxel was found poorly water-soluble and toxic, hence, a water soluble compound, Docetaxel was derived. Docetaxel (Taxotere®), a semi-synthetic derivative of paclitaxel was found more effective. Docetaxel can be used in patients who are resistant to paclitaxel. Both docetaxel and paclitaxel are used as first- and secondline treatment in patients suffering from metastatic cancer, breast cancer and ovarian cancer. These drugs are also found active against lung cancer, prostate cancer and also lymphoid malignancies. The mechanism of action is that these active agents bind to the polymerized microtubules which prevent the normal mitosis to occur and thus they are called anti-mitotic drugs.\(^18\)
1.5.4. Camptothecin (CPT)

It is an anticancer and antiviral alkaloid produced by the Chinese tree *Camptotheca acuminata* (*Nyssaceae*) and some other species belonging to the families *Apocynaceae*, *Olacaceae*, and *Rubiaceae*. Bark and seeds are currently used as sources for the drug. Several attempts have been made to produce CPT from cell suspensions; however, the low yields obtained limit this approach. Cultures of differentiated cell types may be an alternative source of alkaloid production. Hairy root cultures of *C. acuminata* were established from tissue transformed with *Agrobacterium rhizogenes* strains ATCC 15834 and R-1000. Integration of these genes are responsible for the hairy-root phenotype (*rol* genes) into the plant genome was verified by DNA gel blot analysis. The hairy roots produce and secrete CPT as well as the more potent and less toxic natural derivative, 10-hydroxycamptothecin (HCPT), into the medium. Remarkably, the cultures were able to synthesize the alkaloids at levels equal to, and sometimes greater than, the roots in planta, i.e., 1.0 and 0.15 mg/g dry weight for CPT and the HCPT, respectively.

1.5.5. Allium sativum (Garlic)

Garlic has been used for thousands of years to treat various diseases. The earliest use of *Allium sativum* as a medicine has been recorded in ancient Egypt, Greece, India, China, Rome, Russia, and Europe. Hippocrates was the first to recommend its use for cancer. *Allium sativum* contains more than 100 biologically useful secondary metabolites, which include alliin, alliinase, allicin, S-allyl-cysteine (SAC), diallyldisulphide (DADS), diallyltrisulphide (DATS) and methylallyltrisuphide. Garlic oil contains an amino acid known as alliin, which is converted to allicin when its...
bulbs are crushed. Allicin is a precursor to several sulphur-containing compounds that are responsible for the flavour, odour and pharmaceutical properties of *Allium sativum*. Recent studies revealed presence of bioflavonoids quercetin and cyanidin, which are responsible for antioxidant properties of garlic. Ajoene, a sulphur-containing compound, found in garlic oil, inhibits mutagenesis. Garlic oil prevents prostaglandin-dependent cancers by inhibiting lipoygenase and cyclooxygenase enzymes. Garlic contains a rich content of selenium, which is a cellular antioxidant. Diallylthiulfide, diallyldisulphide and S-allyl-cysteine, found in *Allium sativum*, have anticarcinogenic properties. Diallylthiulfide prevents metastases in the lung cancer. Garlic has shown significant therapeutic effect in cancers of the stomach and the intestines. *Allium sativum* inhibits genesis as well as growth of cancer by enhancing activity of the natural killer cells (NK cells) and the macrophages. *Allium sativum* also inhibits metastases by preventing adhesion of the circulating cancerous cells to the blood vessels. A Japanese garlic expert, Wakunaga, worked with a German researcher in the Virgin Woodlands of Hokkaido, Japan and prepared a product called “Kyoic Aged Garlic Extract” in 1954 by using 20-month Cold Ageing Process. This ageing process removes toxic compounds and offensive odour of garlic as well as strengthens its therapeutic properties. The Aged Garlic Extract protects DNA from the damaging effect of carcinogens, increases activity of detoxifying enzymes, speeds up excretion of chemical carcinogens and enhances immunity of the body. The Aged Garlic Extract is found to inhibit growth of many cancers including those of the breast, bladder, skin, colon, oesophagus, stomach and the lung. The research done at National Medical Centre and Hospital in Japan has revealed that the Aged Garlic Extract reduces side effects of radiotherapy and chemotherapy.  

1.5.6. Ginseng  

*Ginseng* (Panax ginseng) is traditionally used in some parts of the world as a popular remedy for various diseases including cancer. It was hypothesized that the ginsenoside Rp1, a component of ginseng, reduces cancer cell proliferation through inhibition of the insulin-like growth factor-1 receptor (IGF-1R)/Akt pathway. Firstly, the efficacy of Rp1 was tested against human breast cancer cell lines. Treatment with Rp1 inhibited breast cancer cell proliferation and inhibited both anchorage dependent and independent breast cancer cell colony formation. In addition, to it the treatment with 20 μM Rp1 induced cycle arrest and apoptosis mediated cell growth suppression. Findings further indicated that Rp1 decreased the stability of the IGF-1R protein in breast cancer cells. Therefore, it is suggest that Rp1 has potential as an anticancer drug and that IGF-1R is an important target for treatment and prevention of breast cancer.  

1.5.7. Tomato  

Tomato (Lycopersicum esculentum) leaves (methanol extract) on cancer cells to address potential therapeutic in MCF-7 breast cancer cell lines and its toxicity towards Vero cells was shown. The effect of extract towards MCF-7 breast cancer cell lines and Vero cells were observed using in-vitro cytotoxicity assay to indicate its active fractions and its half maximal inhibitory concentration (IC50). Purified sample gave a rational effect towards MCF-7 breast cancer cells with IC50 value of 5.85 μg mL⁻¹.  

1.5.8. Curcuma longa (Turmeric)  

Contains curcumin, which inhibits the growth of cancer by preventing production of harmful eicosanoids such as PGE-2. The anticancer effect of curcumin has been demonstrated in all the steps of cancer development, i.e. initiation, promotion and progression of cancer. Data obtained from several studies suggest that curcumin inhibits the genesis of cancer as well as promotes the regression of cancer. Curcumin suppresses mutagenic effect of various mutagens including cigarette smoke condensates 7, 12-dimethylbenz (a) anthracene (DMBA) and benzyopyrene. Curcumin is found to decrease levels of urinary mutagens. It also possesses anti-inflammatory and antioxidant properties. The protective effects of Curcuma longa and its derivatives are partially due to direct antioxidant effect. Studies have revealed that Curcuma longa inhibits production of nitrosamine that enhances natural antioxidant functions of the body. Curcuma longa increases levels of glutathione and other non-protein sulphydryls. It acts directly on several enzymes. Curcumin is used to treat squamous cell carcinoma of the skin and the ulcerating oral cancer. *Curcuma longa* also prevents malignant transformation of leukoplakia.  

1.5.9. Gyrophora esculenta  

*Gyrophora esculenta* (Maitake) is a mushroom that inhibits growth of cancer by enhancing activity of the natural killer cells (NK cells). A study done by Dr. Hiroaki Nanba, Department of Immunology at Kobe Women’s 48 College of Pharmacy, Japan has shown that Maitake inhibits carcinogenesis and metastases. Another study conducted at the National Cancer Research Centre in Japan revealed that the extracts of *Gyrophora esculenta* (Maitake), *Lentinus edodes* (Shiitake) and *Ganoderma lucidum* (Reishi) have completely eliminated tumours in 80 per cent cases.  

1.5.10. Colchicine  

Colchicine is a plant secondary metabolite extracted from *Colchicum autumnale* and *Gloriosa superba* L. It causes mitotic arrest during cell cycle and thus they are considered as potent anti-mitotic drug both in-vitro and in-vivo. Due to severe toxic effects, certain derivatives of colchicine were synthesized namely, 3-demethyl colchicine, colchicoside, thiocolchicoside which showed improved activity against certain leukemic cells and solid tumors.  

1.5.11. Solanum nigrum L. (SNL)  

*Solanum nigrum* Family-Solanaceae has been traditionally used as a herbal plant, whose fruit is believed to have anti-tumor properties, although the mechanism for the activity remains to be elucidated. An
Cucurbitacin, a tetracyclic triterpenoid compound is predominantly obtained from the Cucurbitaceae plants. They possess antiproliferative behaviour against various cancer cell lines. Reports show that Cucurbitacin- I and B selectively inhibit both signal transducer/Janus Kinase 2 (JAK2) activity and activator of transcription-3 (STAT3) pathways. STAT3 is activated in many cancer cell types like prostate cancer, breast cancer and also carcinoma of the head, neck and nasopharynx. Reports show that inhibition of this oncogenic signalling pathway. STAT3 causes tumor cell growth inhibition and leads to apoptosis of cancer cells. Polymeric micelles are used in delivering this compound because of its water insolubility and non-specific toxicity 25, 29.

1.5.13. Withania somnifera

*Withania somnifera* contains withanolides, which possess immuno- modulatory activity. Withaferin A & withanolide D found in *Withania somnifera* are known to inhibit growth of cancer. Studies have revealed that *Withania somnifera* enhances the therapeutic effect of radiotherapy 30.

1.5.14. Ginkgo biloba

*Ginkgo biloba* (Yin Guo/ Bai Guo) contains Ginkgolide-B, which protects the body against cancer. It inhibits growth of cancer by regulating activity of the platelet-activating factor. A recent study done on the workers of nuclear power station at Chernobyl in Russia has shown that *Ginkgo biloba* protects the DNA from damaging effects of nuclear radiation 31.

1.5.15. Combretastatin A-4

Combretastatin A-4 is a naturally occurring stilbene compound obtained from the South African bush willow tree, *Combretum caffrum* Kuntze. This vascular targeting agent disrupts the tubulin structure and the change in morphology of endothelial cells causes deprivation of nutrients to tumor cells by impeding the blood flow through capillaries. Due to its poor solubility, a water-soluble produg called Combretastatin A-4 disodium phosphate has been formulated for experimental purpose which is currently under phase II clinical trials 32, 33.

1.5.16. Irisquinone

Irisquinone, a benzoquinone with anti-tumor activity is obtained from plant species like *Iridaceaealatae palluasi* and *Iris kumaonensis* (Iridaceae). Irisquinone showed good activity against transplantable rodent tumors and also acts as a chemosensitizer 34.

1.5.17. Aloe vera

*Aloe vera* contains aloe-emodin, which activates the macrophages to fight cancer. *Aloe vera* also contains acemannan, which enhances activity of the immune cells against cancer. *Aloe vera* is found to inhibit metastases 35.

1.5.18. Camellia sinensis (Green tea)

*Camellia sinensis* contains epigallocatechin gallate, which protects against cancer by preventing covalent bonding of carcinogens to the DNA. It also inhibits growth of cancer by eliminating free radicals from the body. Gallates found in green tea protect the body from damaging effects of radiation. A regular use of green tea protects the body against many cancers including those of the liver, oesophagus, stomach, intestine and the lung. Studies have shown that there is lower incidence of stomach cancer in habitual tea drinkers as compared to those, who do not drink tea. It has been observed that daily consumption of 5 grams of green tea inhibits synthesis of nitrosamine (a major carcinogen) in the body 36, 37.

1.5.19. Berberine

Berberine, an isoquinoline plant alkaloid is obtained from different plant species including *Hydratis Canadensis L.*, (Ranunculaceae), *Berberineeris species* (Berberidaceae) and *Arcealgelsia flaw* (Menispermaceae). They showed anti-tumor activity both in-vivo and in-vitro report show that berberine has found effective against osteoscaroma, lung, liver, prostate and breast cancer 38, 39.

### CONCLUSION

This review covers the significant role of natural products used in therapy for various ailments. In the present time Natural products are considered to be symbols of protection in comparison to the synthetic product that are regarded as unsafe to human life and environment. Although a large number of synthetic drugs are being added to the world of present pharmacopoeia, but still no system of medicine in the world has been able to solve all the health problems, which include diseases like Cancer. Plant-derived compounds have played an important role in the development of several clinically useful anti-cancer agents. These include vinblastine, vincristine, the camptothecin derivatives, topotecan and irinotecan, etoposide, derived from epipodophyllotoxin, and paclitaxel.

<tbody>
<tr>
<td>Aconite</td>
<td>Dried root of <em>Aconitum napellus, Ranunculaceae</em></td>
<td>Hungary, Germany, Switzerland</td>
<td>Aconitine, hyaconitine, neopelline, napelline, neoline</td>
<td>Treatment of rheumatism, Inflammation.</td>
</tr>
<tr>
<td><em>Allium Sativum</em> (Garlic)</td>
<td>Bulb of the plant known as <em>allium sativum, lilaceae</em></td>
<td>Central Asia, southern Europe, USA and India</td>
<td>Carbohydrate, protein (albumin), fat, mucilage</td>
<td>Carminative, aphrodisiac, expectorant, stimulant, disinfectant</td>
</tr>
<tr>
<td>Artemisia</td>
<td>Unexpanded flower Heads of <em>Artemisia cina, Artemisia bivifolia wall, Artemisia maritime, compositae</em></td>
<td>Pakistan, turkey, from Kashmir to kumaon in Himalayas</td>
<td>Essential oil, santonin, artemisin</td>
<td>Anthelmintic</td>
</tr>
<tr>
<td>Camellia sinensis</td>
<td>Prepared leaves and leaf buds of <em>Thea sinensis, Theaceae</em></td>
<td>India, Shri lanka., China, Indonesia, Japan</td>
<td>Caffeine, theobromine, theophylline, gallatonic acid</td>
<td>CNS stimulant, diuretic</td>
</tr>
<tr>
<td>Comptotheca acuminata</td>
<td>Dried stem wood of <em>comptotheca acuminate, nyssaceae</em></td>
<td>China, Tibet, southern China</td>
<td>Quinoline alkaloid, camptothecin, 10 hydroxy camptothecin, 10 methoxy camptothecin</td>
<td>DNA topoisomerase inhibitors, antitumour, antileukemia</td>
</tr>
<tr>
<td>Catharanthus roseus</td>
<td>Dried whole plant of <em>catharanthus roseus, apocunaceae</em></td>
<td>South Africa, USA, Europe, Australia</td>
<td>Vincristine, vinblastine, ajmalicine</td>
<td>Antineoplastic, acute leukemia, hodgkin’s disease</td>
</tr>
<tr>
<td>Curcuma longa</td>
<td>Dried as well as fresh rhizome of the plant known as <em>curcuma longa, zingiberaceae</em></td>
<td>Tamil Nadu, Andhra Pradesh, Kerala</td>
<td>Curcuminoids, curcumin, volatile oil, starch</td>
<td>Anti inflammatory, anti arthritic, cervical cancer</td>
</tr>
<tr>
<td>Glycyrrhiza glabra</td>
<td>Dried peeled or unpeeled root and stolon of <em>glycyrrhiza glabra, leguminosae</em></td>
<td>Spain, Sicily, England</td>
<td>Glycurhizin, glycyrrhizinic acid which on hydrolysis yield glycyrrhetinic acid</td>
<td>Expectorant, demulcent, antigastric effect</td>
</tr>
<tr>
<td>Panax ginseng</td>
<td>Dried root of <em>panax ginseng, Araliaceae</em></td>
<td>Korea, China, Russia, Canada, USA</td>
<td>Ginsenosides, panaxosides, chikusetsusaponin</td>
<td>Immunomodulatory drugs</td>
</tr>
<tr>
<td>Podophyllum peltatum</td>
<td>Dries rhizomes and root of <em>podophyllum peltatum, barberidaceae</em></td>
<td>From Kashmir to Sikkim and parts of U.P</td>
<td>Podophyllin, podophyllotoxin, alpha and beta peltatins</td>
<td>Cytotoxic action, treatment of veneral, purgative</td>
</tr>
<tr>
<td>Taxus brevifolia</td>
<td>Dried leaves, bark and root of various species of <em>taxus, taxaceae</em></td>
<td>India, Canada, America</td>
<td>Taxane, cephalomannine, 10-deacetyl baccatin, taxol</td>
<td>Lung carcinoma, gastric and cervical cancers and also carcinomas of head, neck, prostate and colon</td>
</tr>
<tr>
<td>Viola odorata</td>
<td>Dried aerial parts obtained from <em>viola odorata, violaceae</em></td>
<td>India (Kashmir) Prades, Kumaon hills</td>
<td>Essential oil, alkaloid, saponins, Glycoside of methyl salicylate.</td>
<td>Expectorant, diaphoretic, antipyretic, antibacterial</td>
</tr>
<tr>
<td>Zingiber</td>
<td>Rhizomes of <em>zingiber officinale roscoe, zingiberaceae</em></td>
<td>South asia, Africa, Australia, Mauritius, Jamaica, Taiwan, India</td>
<td>Volatile oil, starch, fat, fibre, inorganic material, residual moisture, acrid resinous matter</td>
<td>Stomachic, aromatic, carminative, stimulant, flavouring agent.</td>
