**ABSTRACT**

**Objectives:** *Smilax zeylanica* L. is a large, dioecious, scandent climbing shrub and an important medicinal plant belonging to the family Smilacaceae. The present study evaluates antimicrobial and antioxidant potential of leaf and fruit extracts of *Smilax zeylanica* L. (Smilacaceae).

**Methods:** Extraction of powdered leaf and fruit materials was carried out by maceration process using methanol. Phytochemical analysis of extracts was carried out by standard tests. Antibacterial and antifungal activity was evaluated by Agar well diffusion and Poisoned food technique respectively. Antioxidant activity was evaluated by DPPH free radical scavenging assay and Ferric reducing assay.

**Results:** Preliminary phytochemical analysis revealed the presence of alkaloids, flavonoids, tannins, triterpenoids and sterols in both leaf and fruit extracts. Leaf extract was shown to display marked antibacterial activity than fruit extract. Highest and least susceptibility to extracts was observed in case of *Salmonella typhimurium* and *Bipolaris niger* respectively. Leaf extract scavenged DPPH radicals and exhibited ferric reducing potential in a dose dependent fashion. Leaf extract scavenged DPPH radicals more efficiently with IC$_{50}$ value 20.80µg/ml than fruit extract (IC$_{50}$ value 35.85µg/ml).

**Conclusion:** Leaf and fruit extracts of *S. zeylanica* were shown to exhibit antimicrobial and antioxidant activity which may be attributed to the presence of secondary metabolites such as alkaloids, flavonoids, tannins, triterpenoids and sterols. Further studies on isolation of active principles from extracts and their bioactivity determinations are to be carried out.

**INTRODUCTION**

Since time immemorial plants have been widely used as sources of food, construction tools, clothing, spices, dyes and medicine. In various countries across the world, plants are used in primary healthcare either singly or in certain combinations by traditional medicinal practitioners. Countries for e.g. India, China, Bangladesh, Pakistan, Bhutan, Thailand and several European, American and African countries widely employ several plant species as medicine to cure a number of ailments or disorders. Plant based medicines are popular in developing and under-developing countries as the high cost of modern medicines and no access to modern medications to remote places. Plants have also been an indispensable component of traditional medicinal systems namely Ayurveda, Siddha, traditional Chinese medicine (TCM) and Unani. Drugs viz. aspirin, quinine, digitoxin, reserpine, artemisinin,
The genus *Smilax*, belonging to the monocotyledon family Smilacaceae, comprises of about 300-350 species. *Smilax zeylanica* L. (Figure 1) is one of the most important medicinal species of the genus *Smilax* and is distributed in tropical regions of India and is common in forests. *S. zeylanica* is a large, scendent, dioecious climbing shrub with woody stem and angular branches. The plant is sometimes armed with prickles. Flowers are greenish-white, dioecious and umbellate. Fruit is a globose berry that turns red on ripening and contains 1-2 seeds. The plant is known by the name Chopachinee in Sanskrit, Chobchini in Hindi, Kaadu hambu taavare/Chennere balli in Kannada, Jangali Ushbaa in Unani and Malai-thamara in Siddha/Tamil. Leaves are used as vegetable. The plant is used ethnomedicinally for the treatment of various conditions such as venereal diseases, skin diseases, abscesses, boils, psoriasis, rheumatism, swellings, toothache and dysentery.8-12

The plant *S. zeylanica* is used as a substitute for Sarsaparilla in many parts of the world. *S. zeylanica* is a potential alternate source for the Ayurvedic drug Chopachinee (accepted botanical source is *S. china* L.). The plant contains a myriad of chemicals including chemicals viz. diosgenin, smilagenin, sarsapogenin, β-sitosterol, hydroxytyrosol, trans-iso-eugenol and squalene.10,13,14 The plant is shown to exhibit several bioactivities such as antimicrobial15, antioxidant16, cytotoxic16, analgesic15, immunomodulatory17, antiarthritic18, anthelmintic18, antipyretic19, anticonvulsant19, antidiabetic20, cytoprotective21, hepatoprotective22, anti-inflammatory23, antiepileptic24, pesticidal25, thrombolytic26, and antidepressant-like27 activities. The present study was carried out to evaluate antimicrobial and antioxidiant activity of methanolic extract of dried and powdered leaves and fruits of *S. zeylanica*.

**Figure 1: Smilax zeylanica L.**

**MATERIALS AND METHODS**

**Collection and identification of plant**

The plant material was collected at Haniya, Hosanagara taluk, Shivamogga district, Karnataka, India during January 2018. The plant was identified by Dr. Vinayaka K.S assistant professor, KFGC, Shikaripura, Karnataka.

**Extraction and phytochemical analysis**

The leaves and fruits were separated, cleaned well using water, dried under shade and powdered in blender. The extraction of powdered plant material was carried out by maceration process as described in the study carried out by Kekuda et al.28 using methanol. The solvents were subjected to evaporation at room temperature. The crude leaf and fruit extracts were subjected to preliminary phytochemical analyses by standard phytochemical tests.29,30,31

**Antibacterial activity of leaf and fruit extract of S. zeylanica**

Bacteria viz. *Escherichia coli*, *Bacillus cereus*, *Shigella flexneri* and *Salmonella typhimurium* were used to assess their susceptibility to leaf and fruit extracts of *S. zeylanica*. Agar well diffusion method as described in the study of Kekuda et al.28 was performed to evaluate antibacterial activity of leaf and fruit extracts. Streptomycin was used as reference antibiotic. Zones of inhibition formed around the wells were measured using a ruler.

**Antifungal activity of leaf and fruit extracts of S. zeylanica**

Fungi namely *Bipolaris* sp. and *Aspergillus niger* isolated from seeds of maize were screened for their susceptibility to extracts of *S. zeylanica*. Antifungal activity of extracts was evaluated by poisoned food technique as described in the study of Kekuda et al.28 The mycelial growth inhibition (%) caused by extracts was determined using the formula:

\[ \text{Mycebial growth inhibition (\%)} = \frac{\text{Dc} - \text{Dt}}{\text{Dc}} \times 100 \]

where ‘Dc’ and ‘Dt’ denotes diameter of fungal colonies in control (without extract) and poisoned plates respectively.

**DPPH radical scavenging assay**

Various concentrations of the leaf and fruit extracts (12.50-200µg/ml) of *Smilax zeylanica* were screened for their antiradical potential by DPPH assay by following the protocol employed by Kekuda et al.28 Ascorbic acid was used as reference standard. The absorbance of reaction mixture in each of the tube was measured at 520nm and the scavenging of DPPH radicals (%) was determined using the formula:

\[ \text{Scavenging activity (\%)} = \frac{\text{At} - \text{Ac}}{\text{Ac}} \times 100 \] where, ‘Ac’ and ‘At’ refers to absorbance of DPPH control and absorbance of DPPH and extract/ascorbic acid combination. IC_{50} value was calculated for extracts as well as ascorbic acid. IC_{50} value denotes the concentration of extracts/ascorbic acid required to scavenge 50% of free radicals.

**Ferric reducing assay**

Various concentrations of the leaf and fruit extracts (12.50-200µg/ml) of *Smilax zeylanica* were screened for their reducing potential by Ferric reducing assay by...
following the protocol employed by Raghavendra et al.\textsuperscript{32} The absorbance of reaction mixture was read at 700nm. Ascorbic acid was used as reference standard. An increase in the absorbance with an increase in concentration of extracts/ascorbic acid indicates reducing potential of extracts.

RESULTS AND DISCUSSION

Phytochemicals detected in leaf and fruit extracts of \textit{S. zeylanica}

In this study, we performed maceration process to extract powdered leaf and fruit of \textit{S. zeylanica}. The crude leaf and fruit extracts were subjected to phytochemical analysis by standard phytochemical analysis protocols.

Table 1: Phytochemical groups detected in leaf and fruit extracts of \textit{S. zeylanica}

The result of preliminary phytochemical analysis of leaf and fruit extract of \textit{S. zeylanica} is shown in Table 1. The leaf extract was found to contain all tested phytochemicals, while fruit extract was shown to contain all phytochemicals except saponins and glycosides.

Antibacterial activity of leaf and fruit extracts of \textit{S. zeylanica}

In this study, the antibacterial effect of extracts of \textit{S. zeylanica} was determined by agar well diffusion assay. The presence of zone of inhibition around the wells was considered positive for antibacterial activity whereas the absence of zone of inhibition was considered as negative. Both leaf and fruit extracts were effective in inhibiting all test bacteria but the inhibitory activity observed was varied. The result of antibacterial activity of leaf and fruit extract of \textit{S. zeylanica} is shown in Table 2 and Figure 2. Among extracts, marked antibacterial activity was observed in case of leaf extract. Both leaf and fruit extracts inhibited \textit{B. cereus} and \textit{S. typhimurium} to highest and least extent respectively. Among gram negative bacteria \textit{S. flexneri} and \textit{S. typhimurium} were inhibited to highest and least extent respectively. DMSO did not cause any inhibitory activity against test bacteria. When compared to extracts, reference antibiotic displayed highest inhibitory activity. In an earlier study, Sarbadhikary et al.\textsuperscript{33} revealed weak antibacterial potential of ethanol extract of leaves against \textit{E. coli} while other bacteria remained unaffected. In another study, Hossain et al.\textsuperscript{15} investigated the potential of methanolic extract of leaves of \textit{S. zeylanica} and showed a concentration dependent inhibitory activity against test bacteria with marked and least inhibitory activity being observed against \textit{S. paratyphi} and \textit{E. coli} respectively.

Antifungal activity of leaf and fruit extracts of *S. zeylanica*

The potential of leaf and fruit extract of *S. zeylanica* to inhibit seedborne fungi was assessed by poisoned food technique and the result obtained was shown in Table 3 and Figure 3 and 4. Poisoning of medium with the extracts resulted in marked inhibition of mycelial growth of test fungi. Both leaf and fruit extracts inhibited fungal growth to more or less similar extent with leaf extract being more effective than fruit extract. Both extracts were effective in inhibiting the test fungi to >50%. Among fungi *Bipolaris* sp. was susceptible to higher extent when compared to *A. niger*. An earlier study by Saha et al. revealed the antifungal potential of aqueous and ethanolic leaf extracts of *S. zeylanica* to inhibit fungal pathogens of tea viz. *Pestalotiopsis theae, Colletotrichum camelliae, Curvularia eragrostidis* and *Botryodiplodia theobromae*.

DPPH radical scavenging activity of leaf and fruit extracts of *S. zeylanica*

The potential leaf and fruit extract of *S. zeylanica* to scavenge free radicals was determined by DPPH assay and the result is shown in Figure 5. Both leaf and fruit extracts displayed concentration dependent scavenging of DPPH radicals with highest scavenging activity being shown by leaf extract (IC$_{50}$ value 20.80µg/ml) when compared to fruit extract (IC$_{50}$ value 35.85µg/ml). A scavenging activity of >50% was observed at extract concentration of 25 µg/ml and 50 µg/ml in case of leaf extract and fruit extract respectively. At the highest concentration (200µg/ml), both extracts displayed >90% scavenging of DPPH radicals. Hossain et al. revealed the potential of ethanol extract of the leaves of *S. zeylanica* to scavenge DPPH radicals with IC$_{50}$ value of 30.93µg/ml. Daffodil and Mohan showed marked scavenging of DPPH radicals by methanol extract of aerial parts of *S. zeylanica* with an IC$_{50}$ value of 25.77µg/ml. Uddin et al. revealed dose dependent scavenging of DPPH radicals by methanol and petroleum ether extracts of *S. zeylanica* with IC$_{50}$ values 29.14 and 72.40µg/ml respectively. The study of Murali et al. showed potent scavenging activity of methanolic extract (IC$_{50}$ value 7.6µg/ml) when compared to aqueous extract (IC$_{50}$ values 125µg/ml) of roots and rhizomes. In our study, ascorbic acid (reference antioxidant) scavenged DPPH radicals more efficiently (IC$_{50}$ value 6.12µg/ml) than leaf and fruit extracts. Although leaf and fruit extracts exhibited lower scavenging potential, it is evident that the plant possesses proton donating potential and thereby can act as primary radical scavengers.

![Figure 5: Scavenging of DPPH radicals (%) by extracts and ascorbic acid](image)

Ferric reducing activity of leaf and fruit extracts of *S. zeylanica*

The reducing potential of leaf and fruit extract of *S. zeylanica* was determined by ferric reducing activity using ascorbic acid as reference standard. The absorbance of reaction mixtures was measured at 700nm and the absorbance found to increase with the increase in the concentration which indicates the reducing potential. The reducing potential of extracts and ascorbic acid was in the order: ascorbic acid > leaf extract > fruit extract (Figure 6). In an earlier study, Thirugnanasampandan et al. revealed reducing power of leaf and stem extracts of *S. zeylanica*. The study of Uddin et al. revealed marked reducing activity of methanolic extract of stem when compared to aqueous extract of stem. Daffodil and Mohan showed marked reducing potential of methanol extract of aerial parts of *S. zeylanica*. Although the reducing power of leaf and fruit extracts of *S. zeylanica* observed was lesser when compared to reference standard in this study, it is evident that the extracts possess reductive ability which could serve as electron donors, terminating the radical chain reactions.

![Figure 6: Ferric reducing activity of extracts and ascorbic acid](image)
CONCLUSIONS

In the present study, the leaf and fruit extracts of S. zeylanica were shown to exhibit antimicrobial and antioxidant activity. Overall, leaf extract displayed marked inhibitory activity against bacteria and fungi, scavenged DPPH radicals more efficiently and exhibited better ferric reducing activity when compared to fruit extract. The plant can be used to develop formulations effective against infectious agents and oxidative damage. Further studies on isolation, characterization and pharmacological potentials of bioactive principles from S. zeylanica are to be carried out.
