ABSTRACT

Asthma is a common disease that is rising in prevalence worldwide with the highest prevalence in industrialized countries. Asthma affects about 300 million people worldwide and it has been estimated that a further 100 million will be affected by 2025. Ayurveda, Siddha, Unani and Folk (Tribal) medicines are the major systems of indigenous medicines. Over three-quarters of the world population relies mainly on plants and plant extracts for health care. Unlike many diseases, which can be attributed to the lifestyle of modern man, asthma is an ancient illness. There are number of medicinal plants have been reported for antihistaminic/anti-astmatic activities like Ashyranthes aspera, Tephrosia purpurea, Dolichos lablab, Eclipta alba, Jasminum sambac, Balanites aegyptiaca, Viscum album, Tridex procumbens, Glycyrrhiza glabra and Cassia fistula. Present review is focused on used of medicinal plants for treatment of asthma. It is suggested that formulation and patent of the reported medicinal plants is mandatory for further use against asthma and if possible, clinical trials should be done of these plants for their appropriate use.

Keywords: Medicinal plants, Asthma, Mast cells, Antihistaminic.

INTRODUCTION

Herbs are staging a comeback and herbal 'renaissance' is happening all over the globe. The herbal products today symbolize safety in contrast to the synthetics that are regarded as unsafe to human and environment. Although herbs had been priced for their medicinal, flavouring and aromatic qualities for centuries; the synthetic products of the modern age surpassed their importance, for a while. However, the blind dependence on synthetics is over and people are returning to the naturals with hope of safety and security. Over three-quarters of the world population relies mainly on plants and plant extracts for health care. More than 30% of the entire plant species at one time or other was used for medicinal purposes. It has been estimated that in developed countries such as United States, plant drugs constitute as much as 25% of the total drugs, while in fast developing countries such as China and India, the contribution is as much as 80%. Thus, the economic importance of medicinal plants is much more to countries such as India than to rest of the world. These countries provide two third of the plants used in modern system of medicine and the health care system of rural depend on indigenous systems of medicine. Ayurveda, Siddha, Unani and Folk (tribal) medicines are the major systems of indigenous medicines. Among these systems, Ayurveda is most developed and widely practiced in India.

Asthma is a disease of the human respiratory system in which the airways constrict and become narrow, often in response to a "trigger" such as exposure to an allergen, cold air, exercise, or emotional stress. Asthma affects 7% of the total population and approx 300 million worldwide. During attacks (exacerbations), the smooth muscle cells in the bronchial constrict, and the airways become inflamed and swollen. Breathing becomes difficult. Asthma causes 4,000 deaths a year in the U.S. Attacks can be prevented by avoiding triggering factors and by drug treatment.

The modern day's peoples think asthma as a disease is so powerful that it is difficult to imagine person with asthma to live normal healthy life. Once English physicians Thomas Willis and Sir John Floyer began arguing that asthma was different from other breathing disorders and is the same from person to person. They mentioned that asthma, as a specific form of disordered breathing, must be treated differently from other forms of breathlessness cases. But in current scenario, doctors and clinician believed that asthma is a disease which had a specific set of causes, clinical consequences, and need special requirements for treatment, despite the diversity of individual experiences.

Asthma can be classified into 2 stages: the steady-state of chronic asthma, and the acute state of an acute asthma exacerbation. Patient shows different symptoms...
depending on what state the patient is in. Common symptoms include: nighttime coughing, shortness of breath with exertion but no dyspnea at rest, a chronic 'throat-clearing' type cough, and complaints of a tight feeling in the chest. Severity often correlates to an increase in intensity of symptoms. Symptoms can worsen gradually and rather insidiously, up to the point of an acute exacerbation of asthma. It is a common misconception that wheezing is common in patients with asthma—some never wheeze, and their disease may be confused with another chronic obstructive pulmonary disease such as emphysema or chronic bronchitis.6

Asthma may be caused by verity of factors depending from environmental to genetic13 which can influence how severe asthma is and how well it responds to medication.14

Stimuli

- Allergens from nature, typically inhaled, which include waste from common household pests, the house dust mite and cockroach, as well as grass pollen, mold spores, and pet epithelial cells.15
- Indoor air pollution from volatile organic compounds, including perfumes and perfumed products.15
- Medications, including aspirin,16 β-adrenergic antagonists (beta blockers).17
- Use of fossil fuel related allergenic air pollution, such as ozone, smog, summer smog, nitrogen dioxide, and sulfur dioxide.8
- Early childhood infections, especially viral upper respiratory tract infections.18
- Psychological stress and cold weather.19

Some traditional plants with antiasthmatic potential:

Aerva lanta Linn (Amaranthaceae).

Aerva lanta (A. lanta) is an erect or prostrate herbaceous common wayside weed which is recognized by its white axillary bunches of small woolly flowers. It is abundant on the plains in the warmer parts of India. Ethanol extract of aerial parts of A. lanata at 100 mg/mL in the isolated goat tracheal chain preparation model and 30 and 60 mg/kg doses orally in clonidine-induced catalepsy and mast cell degranulation in mice possesses antiasthmatic activity.20

Ageratum conyzoides:

L. Ageratum conyzoides (A. conyzoides) is an erect, herbaceous annual plant from the family Asteraceae (Compositae), native to tropical America, but with a distribution range in tropical and subtropical areas around the world. Hydroalcoholic extract of leaves of A. conyzoides at doses of 250, 500 and 1 000 mg/kg shows antihistaminic activity by inhibiting clonidine induced catalepsy in mice.21

Asystasia gangetica (Acanthaceae):

Asystasia gangetica (A. gangetica) is used in many parts of Nigeria for the management of asthma. Akah, et al. evaluated hexane, ethylacetate, and methanol extracts of the leaves of A. gangetica for antiasthmatic activity using guinea pig trachea; rat stomach strip; guinea pig ileal preparation and egg albumin-induced acute inflammation. The results indicated that the extracts did not exhibit contractile or relaxant activity in isolated tissue preparations; however, they inhibited the contraction evoked by spasmogens.22

Ficus bengalensis Linn (Moraceae):

Ficus bengalensisis (F. bengalensis) is a very large tree reaching about 30 m high and sending down many aerial roots from the branches. Ethyl acetate, ethanol and aqueous extracts as well as fractions isolated from aqueous extract of F. bengalensis bark possesses antiasthmatic activity by inhibiting clonidine induced catalepsy in mice at dose 50 mg/kg. These activities may be due to presence of flavonoids.23,24

Piper betel Linn:

Piper betel is traditionally used to cure cough, cold, puritis, asthma and rheumatism. Ethanol and aqueous extract of leaves at doses 100 and 200mg/kg possesses antiasthmatic activity on histamine induced bronchoconstriction in guinea pig and histamine induced dose dependent contraction of guinea pig tracheal chain and isolated guinea pig ileum preparation.25

Lantana camara (Verbenaceae):

Lantana camara is one such pantropical weed which is affecting ecosystem, and causing biodiversity loss at greater extent. It is a shrub that belongs to the family of Verbenaceae. Lantana camara is one of the notorious weeds causing dramatic and apparently irreversible degradation of natural communities in India. It is highly invasive and currently occupies a large percentage of the vegetation cover wherever it was introduced. Its growth poses a threat to other biodiversity. The species is native of Central and South America and the Caribbean with geographical expansion between 35°N and 35°S. Lantana camara has several therapeutic uses, mainly as herbal medicine27-29. Plant extracts are used for treatment of cancers, chicken pox, measles, asthma, ulcers, swellings, eczema, tumors, high blood pressure, bilious fevers, catarhal infections, tetanus, rheumatism, malaria and atony of abdominal viscera.30 It is further reported that verbascoside, a compound isolated from lantana extract has been demonstrated to possess anti-microbial immunosuppressive and anti-tumour activities. Use of lantana oil in treatment of skin itches and as an antiseptic for wounds and externally for leprosy and scabies is also reported.31

Argemone mexicana Linn (Papaveraceae):

Argemone mexicana known as Chamaoyais an exotic weed indigenous in South America, but has widespread distribution in many tropical and sub-tropical countries including West Africa. It is considered as an important medicinal plant in India. The yellow juice, which exudes when the plant is injured, has found usage as traditional medicine in India for dropsy, jaundice, ophthalmia, scabies and cutaneous infections. Its various parts have been used in chronic skin diseases, emetic, expectorant, demulcent and diuretic, while its seeds and seed oil have been used for the treatment of dysentery, ulcers, asthma and other intestinal infections.32

Datura stramonium Linn (Solanaceae):

Datura stramonium is a wild-growing plant belonging to the Solanaceae family, is widely distributed and easily accessible worldwide. It contains a variety of toxic tropane alkaloids such as atropine, hyoscamine, and scopoline and has been used in Ayurveda for curing various ailments like ulcers, wounds, inflammation, rheumatism, gout,
Sciatica, bruises, swellings, fever, asthma, bronchitis and toothache. Previous studies have revealed pharmacological effects of this plant, however, complete information regarding its pharmacology, toxicity, ethnobotany and phytochemistry still remain.

**Plumbago zeylanica Linn (Plumbaginaceae):**

Plumbago zeylanica is commonly known as white chitraka, belonging to the family Plumbaginaceae. It is distributed as a weed throughout the tropical and subtropical countries of the world. It is a perennial subscandent shrub, growing throughout India, especially in Bengal, Uttar Pradesh, Kerala, Andhra Pradesh, Karnataka and Sri Lanka in most places. Traditionally it is used as a stimulant, digestant, expectorant, laxative, abortifacient and also in the treatment of muscular pain and rheumatic disease.
