**ABSTRACT**

The present study is aimed to investigate the effect of *Cynodon dactylon* on the haematological parameters of freshwater fish *Ctenopharyngodon idella*. The study reveals that there was a slight variation noticed in total serum protein, globulin, albumin, glucose, cholesterol and triglycerides. There was a significant variation observed in Red blood corpuscles (RBC), White blood corpuscles (WBC), Haemoglobin (Hb), MCH, MCHC, PCV in the blood of grass carp fed with control and *Cynodon dactylon* mixed diet. The protein content of experimental fishes showed higher value than other components. The result of the study indicates that the fish are rich source of animal protein and moderate amount of cholesterol and triglycerides. Hence, it suggested that the fish consumed medicinal plants are suitable for human consumption.

**Keywords:** Grass carp, *Cynodon dactylon*, Haematology, Haematocrit.

**INTRODUCTION**

Aquaculture is the farming of economically important aquatic organisms under controlled condition. Development of aquaculture is mainly dependent on availability of suitable nutrients formulated diets. Adding of medicinal plants as one of the ingredient in fish feed improve the immunity of fish and inhibit the microbial pathogens. The study of haematology in fishes used for early diagnosis of disease.  

*Cynodon dactylon* is an important medicinal plant and play a major role in Ayurvedic medicine. It purifying blood, anuria, biliousness, conjunctivitis, diarrhea, gonorrhea, itching and stomach ache. According to 13 a medicinal plant *Cynodon dactylon* act as an antibacterial agent against several bacterial pathogens in the freshwater carp *Catla catla*. The study on haematology in fishes act as a good parameter, which provides early diagnosis of disease, toxicity, the effect of environmental stress and nutritive value of diets and status of fish health.

The quality and quantity of dietary protein may reflected biochemical composition, haematology, haematocrit and enzyme activity in fishes. The use of alternative feed stuff from plant parts and biproducts should improve growth, nutritive value and immunity of fish. Fish feed containing *C. dactylon* influence the growth, biochemical composition, haematology, enzyme activities of fish. Blood parameter in fish is easily affected by water temperature, feed intake, movement and photoperiod. The present study is aimed to investigate the haematology and haematocrit of freshwater carp *C. idella* fed *C. dactylon* mixed diet.

**MATERIALS AND METHODS**

Alive freshwater grass carp *Ctenopharyngodon idella* fingerlings weight ranging from 50 to 55 g were collected from Himalayan Fish Farm located at Thittai near Thanjavur. The collected fishes brought to the laboratory in polythene bags filled half with water. These fishes acclimatized for seven days in fibre aquarium. The fish tanks were kept free from fungal infection by washing with potassium permanganate solution, then fishes were disinfected with 0.1% potassium permanganate solution. The fishes were divided into two groups one as control and other as the experimental group. Each group consisting of 20 fishes. The fishes were exposed to control diet, and plant powder mixed diet for a period of 30 days. On 15th and 30th day blood samples were collected from both control and experimental group. Blood samples were drawn by cardiac puncture using twenty one gauge hypodermic needle in collection bottle containing disodium...
salt of EDTA. Standard haematological procedure described by Blaxhall and Diasley (1973) were adopted. The methods employed for determination of various haematological parameters were referred to total serum protein (Welchelbaum, 1946), globulin, albumin (Wets, 1965), glucose (Smith, 1979), cholesterol (Fleg, 1973), Triglycerides (Fossati, 1982) and blood parameters such as haemoglobin (Hb), Red Blood Cells (RBC), White blood cells (WBC), Packed cell volume (PCV), Mean Corpuscular haemoglobin (MCH), Mean Corpuscular haemoglobin concentration (MCHC) (Daecie and Lewis, 1984).

Preparation of fish feed

For the present study two types of feed pellets were prepared by following the method of Bindo and Sobha (2004). The control feed was prepared by using standard basic diet ingredients such as rice bran (40%), groundnut oil cake (30%), Fish meal (15%), wheat flour (7%), Tapioca flour (7%), Vitamin and minerals mix (1%). The experimental diet containing Rice bran (35%), Groundnut oil cake (25%), fish meal (15%), wheat flour (7%), Tapioca flour (7%), vitamin and mineral mix (1%) and powder of Cynodon dactylon plant (10%).

RESULT

Result obtained for haematocrit values of freshwater grass carp Ctenopharyngodon idella exposed to control diet and Cynodon dactylon powder mixed diet are given in the table 1. From the data, it clearly shows that the haematocrit parameters significantly fluctuated between blood pictures of control and experimental fishes. The serum protein content was found to be recorded maximum in the blood of control and experimental fishes. The biochemical components such as protein, globulin and glucose showed higher value in experimental fishes and it was lower in control fish. Albumin, cholesterol and triglycerides in control fish slightly higher than experimental fishes. The result of the haematological studies of Ctenopharyngodon idella is given in the table 2. The data clearly indicates that there was a significance increase in the Haemoglobin (Hb), Red blood corpuscles (RBC), Packed cell volume (PCV), Mean Corpuscular haemoglobin (MCH), Mean corpuscular haemoglobin concentration (MCHC) whereas the White blood corpuscles (WBC) shows slight fluctuation between control and experimental fishes.

DISCUSSION

Blood acts as an internal transport medium which is responsible for supplying oxygen, water, nutrients, food and hormones, removing carbon-di-oxide and nitrogenous waste. It involves in the maintenance of body temperature and production of antibodies 19. Most of the blood parameters are relatively constant under normal conditions and must also have the ability to change it under extreme conditions like stress, food availability, nutritive value of diet etc. 2,17,22,24.

In the present study haematocrit of freshwater grass carp Ctenopharyngodon idella exposed to Cynodon dactylon powder mixed diet shows a significant result. The protein showed higher value when compared to other parameters. The maximum value of protein in both control and experimental fishes are agreement with earlier observation 1,10,12,20. According to 16 increase in serum protein, albumin, and globulin in fishes in supposed to be associated with stronger innate immune response. Glucose content in the experimental fish was slightly higher than control fish. However, cholesterol and triglycerides slightly higher in control fish than experimental fish. Similar trends were reported for glucose, cholesterol and triglycerides 13,18,20,21,24.

The haematological parameters such as Haemoglobin, RBC, WBC, PCV, MCH and MCHC showed significant variation, when the fish exposed to Cynodon dactylon mixed diet. The trend of haematological parameters in Ctenopharyngodon idella agrees with earlier observation 1. Increase level of RBC and haemoglobin were observed in A. hydrophila infected Cyprinus carpio 11. Juvenile hybrid tilapia fed with high protein diet decreased RBC and WBC level 27. 13 have reported that RBC, WBC count increased in 0.5 and 5% concentration of Cynodon dactylon mixed diet. The RBC,
haemoglobin, PCV were decreased whereas WBC and lymphocytes were increased when the fish Clarias gariepinus exposed to Moringa oleifera mixed diet. WBC, RBC counts Hb, Ht, MCH and MCHC were significantly increased in the Oreochromis mossambicus exposed to Cydonon dactylon mixed diet.

Biochemical and haematological variation observed in Clarias gariepinus and Clarias batrachus fed plant and plant biproducts mixed diet. According to 14 leaf extract of Cydonon dactylon to screen the antibacterial activity against infectious disease causing bacterial pathogens. Digestibility, growth, blood chemistry and enzyme activity of Oreochromis niloticus significantly varied when the fish fed with animal and plant dietary byproducts. The result of the study revealed that in C. idella haematological and haematoctrit values were within acceptable limits when the fish fed with C. dactylon mixed diet and control diet.

CONCLUSION

The study reveals that the experimental fish Ctenopharyngodon idella are hygienic, good nutritive value, rich protein with moderate amount of glucose, cholesterol and triglycerides. Further Cydonon dactylon mixed diet increase the protein and immunity and decrease triglycerides level. Hence, it suggested that the fish fed with medicinal plants mixed diet is suitable for culture and human consumption.
