**ABSTRACT**

**Aim:** The present study is aimed to evaluate *in-vitro* anti-inflammatory and anti-bacterial activity of phenolic ethereal oils like Tulsi (*Ocimum tenuiflorum*) and Clove (*Syzygium aromaticum*).

**Materials and methods:** A total of 500 g of fresh leaves and dried flower buds of Tulsi and Clove were subjected to hydro-distillation method for 6 h using Clevenger’s apparatus. The isolated ethereal oils were used for testing the *in-vitro* anti-inflammatory activity by using albumin denaturation assay, protease inhibitory activity at a concentration of 20, 40, 60, 80 and 100 µl/ml and anti-bacterial activity against two gram positive microorganisms (*Bacillus subtilis* and *Staphylococcus aureus*) and two gram negative microorganisms (*Salmonella typhi* and *Escherichia coli*) at concentrations 50 µl/ml, 100 µl/ml and 200 µl/ml by adopting cup plate method.

**Results:** The isolated ethereal oils exhibited significant *in-vitro* anti-inflammatory effect and also inhibited the growth of both Gram positive and Gram negative microorganisms at 50 µl/ml, 100 µl/ml and 200 µl/ml concentrations.

**Conclusion:** The findings of this study showed that the effectiveness of phenolic ethereal oils isolated from Clove and Tulsi. Clove (*Syzygium aromaticum*) showed enhanced anti-inflammatory and anti-bacterial activity compared to Tulsi (*Ocimum tenuiflorum*). The present study provides evidence that *Ocimum tenuiflorum* and *Syzygium aromaticum*; Phenolic ethereal oils contain medicinally important bioactive components justifying its traditional use.

**Keywords:** Phenolic ethereal oils, anti-inflammatory activity, anti-bacterial activity, *Ocimum tenuiflorum*, *Syzygium aromaticum*.

**INTRODUCTION**

Ethereal oils are the volatile fractions of aromatic and medicinal plants. They are a good source of several bioactive compounds, which possess anti-inflammatory, anti-microbial, anthelmintic, anti-viral, anti-cancer, anti-oxidant and insecticidal properties. Phenolic ethereal oils are a unique class of aromatic oils due to the presence of considerable amounts of volatile phenolic constituent’s. They are of great importance as anti-bacterial, anti-inflammatory and anti-oxidant properties. Examples of phenolic ethereal oils include eugenol, thymol, and carvacrol which are usually the major constituents of Clove, Tulsi and Thyme oils respectively.

**MATERIALS AND METHODS**

**Plant material**

The Fresh leaves of Tulsi (*Ocimum tenuiflorum*) are collected from Venkatapur Village, Medchal District, Telangana, India.

The Dried unripe flower buds of *Syzygium aromaticum* was procured from local market Hyderabad. Voucher specimens’ were preserved in the herbarium of School of Pharmacy, Anurag Group of Institutions, Venkatapur, Ghatkesar, Telangana, India.

*Ocimum tenuiflorum* (holy basil) is cultivated on a large scale in India and in the Southeast Asian. It is cultivated for medicinal use and for religious belief. It has long been documented as a diverse and rich source of ethereal oils. At the same time, it is used in cooking for its flavor and fragrance, so the fresh or dried leaves were add to many...
foods, such as rice, pasta, and salads in addition the, herb has medicinal and cosmetic uses. Traditionally the various parts like leaves and flowers are being used to treat various disorders such as skin disorders, cold, fevers, vomiting, and cough swelling. The ethereal oil of Ocimum tenuiflorum is characterized by remarkably high concentrations of methyl eugenol (82.9%). The other minor constituents were β-caryophyllene (4.1%), bornol (2.4%), germacrene-D (2.3%) and α-copaene (1.9%). Phenyl derivative (83.8%) constituents were the prominent group of compounds followed by sesquiterpene hydrocarbons (11.1%), oxygenated monoterpenes (3.1%), monoterpenic hydrocarbons (0.6%) and oxygenated sesquiterpene (0.3%) 

Clove (Syzygium aromaticum) is one of the most valuable spices that have been used for residential and for many medicinal purposes. Clove is native of Indonesia but nowadays is cultured in several parts of the world. The plant represents one of the richest sources of phenolic compounds such as eugenol, eugenol acetate and gallic acid and possess a great potential for medical, cosmetic, food and agricultural applications. The secondary metabolites produced by the plant are used for antibacterial, anti-inflammatory, and anti-oxidant properties. 

The ethereal oil of Clove is contains high concentrations of 70.1% of eugenol, β-caryophyllene (4.8%), α-humulene (0.55%), α-terpenyl acetate (0.1%), methyl eugenol (0.2%), humulene epoxide (0.2%), and chavicol (0.3%). On the other hand, a number of compounds like sesquiterpenic hydrocarbons, alcohols and oxides, methyl ketones, aliphatic alcohols, and esters are present in trace amounts.

**Extraction of the ethereal oils**

Leaves and flower buds were subjected to hydro-distillation for duration of 6 hours using 500ml of distilled water in Clevenger apparatus. The obtained yield was 1.0% (Tulsi) and 1.4% (Clove). It was then stored in a screw capped glass vials in a refrigerator maintained at 4-5 °C until use.

### RESULTS AND DISCUSSION

**In-vitro anti-inflammatory screening**

**Inhibition of albumin denaturation**

The reaction mixture (5 ml) consisted of 0.2 ml of egg albumin (from fresh hen’s egg), 2.8 ml of phosphate buffered saline (PBS, pH 6.4) and 2 ml of varying concentrations of the essential oils was added to reach final concentrations (20, 40, 60, 80, and 100 µl/ml). Similar volume of double distilled water served as control. Then the mixtures were incubated at 37±2 °C in an incubator for 15 minutes and then heated at 70 °C for 5 minutes. After cooling down, their absorbance was measured at 660 nm using vehicle as blank. The Diclofenac sodium at the final concentration of (20, 40, 60, 80, and 100 µl/ml) was used as reference drug and treated similarly for determination of absorbance.

**Anti-protease action**

The reaction mixture (2 ml) include 0.06 mg trypsin, 1 ml 20Mm Tri HCL buffer (pH 7.4) and 1 ml test sample of different concentrations (20-100 µl/ml).The mixture was incubated at 37 °C for 5 minutes and then 1ml of 0.8% casein was added. The mixture was incubated for an additional 20 minutes. 2ml of 70% perchloric acid was added to arrest the reaction. The cloudy suspension was centrifuged and the absorbance of the supernatant was read at 210 nm against buffer as blank. The experiment was performed in triplicate. The percentage inhibition of proteinase inhibitory was calculated.

**In vitro anti-bacterial activity screening**

**Test organisms**

Two strains of gram-negative bacteria Escherichia coli, Klebsiella pneumoniae, and two strains of gram-positive bacteria Bacillus subtilis and Staphylococcus aureus were used in our experiment to evaluate the anti-bacterial activity.

**Disc diffusion Method**

Disc diffusion method for anti-microbial susceptibility testing was carried out to assess the presence of anti-bacterial activities of the isolated volatile oils from Clove and Tulsi.

ZI were expressed as Mean±Standard deviation of three replicates, low activity (1-6 mm), moderate activity (7-10 mm), high activity (11-15 mm).
**CONCLUSION**

The above results of anti-inflammatory and anti-bacterial activity of *Ocimum tenuiflorum* and *Syzygium aromaticum* confirmed us as a useful anti-inflammatory and anti-bacterial agent. The present study provides evidence that *Ocimum tenuiflorum* and *Syzygium aromaticum* isolated ethereal oils contains medicinally important bioactive compounds and this justifies the use of plant species as traditional medicine for treatment of inflammation and bacterial infections. Furthermore, a detailed and systematic approach can be done in exploiting and identifying the phytopharmacology to explore in knowing the maximum potentiality of the plant which will be useful to mankind.
