**ABSTRACT**

Many indigenous Indian medicinal plants have been found to be successfully used to manage diabetes and some of them have been tested and active principles isolated. However, search for new antidiabetic drugs for effective treatment is on. The vast majority of people on this planet still rely on their traditional material media (medicinal plants and other materials) for their everyday health care needs. It is also a fact that one quarter of all medical prescriptions are formulated based on substances derived from plants or plant-derived synthetic analogs. The herbal drug from tribal region is selected for the study which is used for diabetes and liver diseases. *Pergularia daemia* (Asclepiadaceae) is a perennial herb growing widely along the road sides of India. It has been used in folk medicine for the treatment of Diabetis mellitus liver disorders. It is widely distributed in the tropical and subtropical regions of the world. Various phytochemical including terpenoid, flavonoids, sterols and cardenolids have been isolated and identified from the various parts of the plant (leaves, stems, shoots, roots, seeds and fruits whole plant)*. P. daemia* widely used by various tribal communities in Western Ghats of India for the treatment of variety of ailments, while predominantly the roots of the plant have been used to treat liver disease and jaundice. The present review article aims towards medicinal Pharmacological potential, Bioactive remedies, Phytochemical profile and other important aspects of *P. daemia*.

**Keywords:** Ethnobotanical uses, *Pergularia daemia*, Pharmacological Profile, Phytochemical Profile

**Article Info:** Received 14 June 2019; Review Completed 19 August 2019; Accepted 23 August 2019; Available online 30 August 2019

**Introduction**

The plant drug research appears to be complementary to the ongoing synthetic research. World Health Organization in its technical report appears to be on promotion for development of traditional system of medicine. The greatest disadvantage in the presently available potent synthetic drug lies in their side effect, toxicity and reappearance of symptoms after discontinuation. *Pergularia daemia* (Forsk.) Chiov (Apocynaceae), commonly known as uttaran (Hindi), Duspatuchetti (Telugu), Uttamarami (Sanskrit) is a slender, hispid, fetid smelling laticiferous twiner found in the plains throughout the hot parts of India. *P. daemia* is said to have more magical application than medical application as it possesses diverse healing potential for a wide range of illnesses. Some of the Folklore people use this plant to treat jaundice, as laxative, anti-pyretic, expectorants and also in infantile diarrhea. The leaf latex is locally used as pain killer killer and for relief from toothache the sap expressed from the leaves are held to cure sore eyes in Ghana. The plant reduces the incidence of convulsion and asthma. It is used to regulate the menstrual cycle and intestinal functions. The root is useful in treating leprosy, mental disorders, anemia and piles.

The roots of *Pergularia daemia* have been used to treat inflammation and pain and to reduce the fever by the folklore people of Salem, Dharmapuri and Coimbatore district, Tamilnadu state, India. Both plants are widely distributed to the Southern parts of India. *P. daemia* (Asclepiadaceae) is known as “Veliparuthi.” in Tamil, “Uttaravaruni” in Sanskrit and “Utranajutuka” in Hindi. *C.carrandas* belonging to the family of Apcocyanaeae is commonly known as Christ’s thorn or Bengal Currant, ‘Kalakke’ in Tamil 1, Traditionally the plant *P. daemia* is used as anthelmintic, laxative, anti-pyretic and expectorant, and is also used to treat infantile diarrhoea and malarial intermittent fevers 2-4. Latex of this plant is used for toothache 5 Stem bark of this plant is remedy for cold and fever 7. Aerial parts of this plant are reported to have various pharmacological activities like hepatoprotective 9, antifertility, anti-diabetic, analgesic, anti-inflammatory 9-11. Phytochemically the plant has been investigated for cardenolides, alkaloid and saponins and it
has been found that contains various triterpenes and steroidal compounds.\textsuperscript{12}

**Plant Taxonomy: *Pergularia Daemia* Linn**

A slender, hispid, fetid-smelling perennial climber. Leaves opposite, membranous, 3-9 cm long and about as wide, broadly ovate, orbicular or deeply cordate, acute or short-acuminate at apex, pubescent beneath, petioles 2-9 cm long. Flowers greenish-yellow or dull white tinged with purple, borne in axillary, long-peduncled, drooping clusters. Fruits (follicles) lanceolate, long-pointed, about 5 cm long, covered with soft spines and seeds are pubescent, broadly ovate.

Flowering may occur each year between August and January in central India, with fruits maturing from October to February. In central Indian deciduous forests, the stems typically die down in February and reappear with the onset of the rainy season.\textsuperscript{13-14}

**Habitat:**

A widely distributed in the tropical and sub-tropical area. In India it is very commonly found in hedges through cut most of canopy to an altitude about 1000m in Himalayas and 900m in Southern India.\textsuperscript{14}

**Vernacular Names:**

*P.daemia* (Forsk) Chiv or *P.extensa* N.E.Br or *Daemia extensa* R.Br \textsuperscript{15}

Bengali: Chagulbanti, Changulbati

Guajarat: Amardudhel, Chamardudhel

Hindi: Utranajutuka, Utran, Dudhi, Dudhibel

Kannada : Haalu koratige, Hala koratige

Malayalam : Veliparatti, Veliparuti

Marathi : Utaranavel, Uturhi

Oriya : Jukiruhi, Uttruri, Uturdi

Sanskrit : Uttararvaruni, Kurutakah,Yugaphala,

Tami : Beliparti, Nandamani, Uthamani, Veliparuthi

**Taxonomy classification**\textsuperscript{16}

Kingdom : Plantae

Subkingdom : Tracheobionta

Super division: Spermatophyta

Division : Magnoliophyta

Class : Magnoliopsida

Subclass : Asteridae

Order : Gentianales

Family : Asclepiadaceae

Genus : Pergularia

Species : *P. daemia* (Forsk) Chiv.

**Ethnomedical Information**

Aerial parts& Whole Plant is used for snake bite, in dibetics mellitus.\textsuperscript{17} Entire plant used as an anthelmintic, emmenagogue, emetic, antiseptic, emetic , expectorant and antivenin and used to facilitate parturition\textsuperscript{21}, while used in Ayurvedic medicine for delayed childbirth, amenorrhea, asthma, snakebite, rheumatic swellings\textsuperscript{22} and used to treat post-partum hemorrhage. Latex of this plant used for boils and sores.\textsuperscript{23} Dried leaf used as an emetic, antirheumatic and used for bronchitis, amenorrhea, dysmenorrheal, asthma and constipation\textsuperscript{29}, while fresh root used as an abortifacient and used to treat gonorrhea\textsuperscript{30-31}. Shoots used to treat whooping cough\textsuperscript{22}. Stem bark has been used to treat malaria and twig used as an antipyretic and appetizer\textsuperscript{33}.

**Phytochemical Profile**\textsuperscript{34-38}:

Phytochemicals reported to contain β-sitosterol, lupeol, lupeol acetate, \(\alpha\), \(\beta\)-amyrin and its acetate in entire plant and root.

Isolated lupeol-3-beta trans crotonate and oleanolic acid acetate from dried whole plant.
Betaine, hentriacontane and pentacosanoic acid from entire plant, while reported to contain magnesium and potassium carbonate, daemia extensa polypeptide, Ca, Mg and K oxalate.

Daucosterol

Hentriacontane

Various cardenolide such as calotoxin, calotropagenin, dihydro calotropagenin, calotropin and uscharidin in seed, while coroglaucigenin, corotoxigenin, uscharidin and uzarigenin in stem.

Uscharidin reported to contain calactin, calotropin, corotoxigenin, daucosterol and sucrose in root reported to contain various cardenolide such as calotoxin, calotropagenin, dihydro calotropagenin, calotropin and uscharidin in seed, while coroglaucigenin, corotoxigenin, uscharidin and uzarigenin in stem. Uscharidin also reported to contain calactin, calotropin, corotoxigenin, daucosterol and sucrose in root.

Inhibitory Potential of Important Phytochemicals: Study of β-sitosterol, β-amyrin, a-amyrin and lupeol were identified in the leaf by GC-MS. Molecular docking studies were performed to evaluate their activities on phospholipase A2 (PLA2) and L-amino acid oxidase enzymes which constituted a rich source in snake venoms (Naja naja). Snake venom phospholipase A2 with PDB code 1A3D devoid of co-crystallized ligand was extracted from Protein Data Bank. Using Molegro Virtual Docker two cavities are formed by cocrystallization. L-Amino acid oxidase (PDB code 4E0V) was a receptor model with a co-crystallized ligand FAD. Among the phytochemicals analysed, β-sitosterol displayed high affinity of binding to the active site regions of phospholipase A2 and L-amino acid oxidase, respectively.

Phytochemical screening & GC-MS Analysis: This study was implemented to actuate the chemical components of pergularia daemia linn using perkinelmer gas chromatography mass spectrometry our results of GC compounds in the extracts was relevant to the national institute of standard & technology (NIST) library. GC-MS Analysis of ethanolic extract leaves confirms the presence of hexadecanoic acid, methyl ester pentadecanoic acid, &4-4-chlorobenzoyl-1-cyclohexyl-5-tosylamino-1H-123 zale. Qualitative phytochemical screening of ethanolic extract shows the presence of many compounds flavonoids, tannins, alkaloids, phenols, steroids. This study result will make a way for the production of herbal medicine for various elements by using pergularia daemia leaves.

Larvicidal activity of silver nanoparticles synthesized: The bioactivity of latex-producing plant Pergularia daemia as well as synthesized silver nanoparticles (AgNPs) against the larval instars. The range of concentrations of plant latex (1,000, 500, 250, 125, 62.25, and 31.25 ppm) and AgNPs (10, 5, 2.5, 1.25, 0.625, and 0.3125 ppm) were prepared. The LC50 and LC90 values for first, second, third, and fourth instars of synthesized AgNPs-treated first, second, third, and fourth instars of A. aegypti (LC50 = 4.39, 5.12, 5.66, 6.18; LC90 = 5.90, 11.13, 12.40, 12.95 ppm) and A. stephensi (LC50 = 4.41, 5.35, 5.91, 6.47; LC90 = 10.10, 12.04, 13.05, 14.08 ppm) were found many fold lower than crude latex-treated A. aegypti (LC50 = 55.13, 58.81, 75.66, 94.31;
LC_{50} = 113.00, 118.25, 156.95, 175.71 ppm) and A. stephensi (LC_{50} = 81.47, 92.09, 96.07, 101.31; LC_{50} = 159.51, 175.97, 180.67, 190.42 ppm). The UV-visible analysis shows absorbance for AgNPs at 520 nm. TEM reveals spherical shape of synthesized AgNPs. Particle size analysis revealed that the size of particles ranges from 44 to 255 nm with average size of 123.50 nm. AgNPs were clearly negatively charged (zeta potential = -27.4 mV). This is the first report on mosquito larvicidal activity P. daemia-synthesized AgNPs.

Qualitative & Quantitative analysis of stem bark of P. Daemia: Medicinal plants are a pride of our nature. It is estimated that there are more than 45,000 species of medicinal plant present in India. A few traditional ethnomedicinal plant is Pergularia daemia. It is a hispid perennial twining herb distributed in the roadsides of tropical and sub tropical regions. The whole plant possess more medicinal values and traditionally used in the treatment of various ailments. The present study involves to determine the qualitative and quantitative analysis of stem of Pergularia daemia in different solvents like thanol, ethanol, chloroform, petroleum ether and aqueous. The results of which showed the presence of alkaloids, steroids, terpenoids, flavanoids, saponins, phenols, tannins, aminoacids, cardiac glycosides, carbohydrates and proteins. The quantification of the compounds like alkaloids, flavanoids and phenols were estimated. The result confirms that the stem of Pergularia daemia possess significant phytocomponents as mentioned in traditional claims and highlights it as the source of many pharmacological studies and a curative for various ailments.

Phytochemical Studies on the Leaves: Pergularia daemia is a fetid smelling, perennial twining herb, widely distributed in the roadsides of tropical and sub tropical regions. It is used as an important medicinal plant since ancient times. The present study deals with the qualitative and quantitative analysis of the leaves of Pergularia daemia in different solvents and also this study deals with the separation of compounds present in crude methanolic extract of Pergularia daemia leaves by High Performance Liquid Chromatography. The qualitative analysis of the leaves showed the presence of alkaloids, steroids, terpenoids, flavanoids, saponins, phenols, tannins, aminoacids, cardiac glycosides, carbohydrates and proteins. The quantification of the compounds like alkaloids, flavanoids and phenols were done. HPLC shows the presence of two major peaks and exhibited the presence of two major components in the methanic extract of the leaves. The results suggested that Pergularia daemia has significant phytocomponents and can be used as a source for many pharmacological studies and a curative for various ailments.

Pharmacological Profile:- As a Phytomedicine: Pergularia daemia has been traditionally used as an anthelmintic, laxative, antipyretic expoctorant and also used to treat infantile diarrhea and malarial intermittent fevers. It is widely distributed in the tropical and sub-tropical regions of the world. Various phytochemical including terpenoid, flavonoids, sterols and cardenolid have been isolated and identified from the various parts of the plant (leaves, stems, shoots, roots, seeds and fruits). P. daemia widely used by varoustrial communities in Western Ghats of India for the treatment of variety of ailments, while predominantly the roots of the plant have been used to treat liver disease and jaundice. The present review article aims towards medicinal properties, chemical constituents and other important aspects of P. daemia.

Antifertility activity of Alkaloidal Fraction: The ethanolic extract of pergularia daemia its steroidal fraction is reported to have antifertility activity. In this work we studied the alkaloidal fraction of ehtanolic extract to observe its antifertility activity. Oral administration of ethanolic fraction of alkaloidal extract 200 mg/kg of body weight shows significant activity in preimplantation of stage of female mice.

Amelioratory effect of flavonoids: The whole plant, Pergularia daemia (Family: Asclepiadaceae), extract (50% alcohol) was investigated for its antiulirtic and diuretic activity. Ethylene glycol (0.75% in water) feeding resulted in hyperoxaluria as well as increased renal excretion of calcium and phosphate. Alcoholic extract (400 mg/kg) of P. daemia was given orally in curative and preventive regimes over a period of 28 days. The results were comparable with the standard drug, sodium ascorbate (25 mg/kg), of the extract. The extract exhibited significant diuretic activity at dose of 400 mg/kg body weight as evidenced by increased total urine volume and the urine concentration of Na, K, Ca, and P. These findings affirmed assertions made regarding the effectiveness of the extract of this plant against urinary pathologies in the Indian folk medicine.

Anti-inflammatory, Analgesic and Antipyretic activity: Crude ethanol extract of Pergularia daemia leaves was successively fractionated with petroleum ether, solvent ether, ethyl acetate, butanol and butane. The ethanolic extract and various fractions were investigated for anti-inflammatory activity in rats at a dose of 100 mg kg\(^{-1}\) i.v. intraperitonially. Ethanol extract and its butanol fraction exhibited significant anti-inflammatory activity when compared with respective controls and were comparable with that of standard drug aspirin. Another study was also demonstrated on the anti-inflammatory activity of Pergularia daemia by using various solvent extracts. In the result they found that alcohol extract of P. daemia showed significant reduction in swelling of paw at a dose of 300 mg kg\(^{-1}\) b.wt. which was equivalent to diclofenac sodium as a standard in a dose of 15 mg kg\(^{-1}\) b.wt. The anti-inflammatory activity of Pergularia daemia extract could be attributed due to the presence of steroids. Analgesic effect of aqueous and ethanol extract of Pergularia daemia was demonstrated in the experimental models using Eddy’s hot plate and Heat conduction method using thermal stimuli. Both extracts showed the analgesic activity when compared with control and analyzed statistically by Tukey Kramer Multiple Comparison Test. Antipyretic activity was also reported from the aerial parts of Pergularia daemia extract.

Central nervous system depressant activity: The roots of P. daemia were evaluated for central nervous system depressant activity. This study was investigated on Swiss albino mice using chlorpromazine and pentobarbtoine sodium induced sleeping time. Alcohol and aqueous root extract of P. daemia showed significant central nervous system depressant activity and was compared with that of control and drug treated groups. Their results concluded that both alcohol and aqueous extract showed central nervous system depressant activity and this activity is mainly due to the presence of glycosides present in P. daemia roots.

Hepatoprotective activity: Pergularia daemia is traditionally used as a folk medicine for treating jaundice. A preliminary investigation on the aerial parts of Pergularia daemia showed significant hepatoprotective activity. The whole plant, Pergularia daemia showed hepatoprotective activity due to the presence of flavonoids and their derivatives.

ISSN: 2250-1177 CODEN (USA): JDDTAO
activity at a fixed dose level of 200 mg kg⁻¹. Furthermore, extended their study to identify the active compounds of P. daemia which are responsible for hepatoprotection. They investigated on both aqueous and ethanolic extract which showed the presence of triterpenoids and flavonoids in ethanolic extract. Their result suggests that presence of flavonoids in P. daemia could be responsible for hepatoprotection. In addition, an in vitro evaluation hepatoprotective activity of Pergularia daemia was also investigated. Iethanolic extract. The result of this study also justify that flavonoids are responsible for hepatoprotective activity. Thus, it is evident from these studies that flavonoids like quercetin, kaempferol and isorhamnetic glycosides could be liable for various liver disorders.46

Antioxidant activity: In vitro screening of antioxidant activity on P. daemia root extract. In their preliminary pytochemical test, both aqueous and ethanolic extract indicated the presence of alkaloid, glycoside, steroid, flavonoid, saponin, terpinoid, tannin and phenolic compound. The result obtained from their study shows that P. daemia exhibited antioxidant activity which may be attributed to the presence of polyphenolic and other pytochemical constituents. This may be used in preventing oxidant stress related degenerated diseases.47

Anticancer activity: Anticancer activity of Pergularia daemia was screened against sixty human cancer cell lines and was organized into sub panels representing lakuæmia, melanoma and cancer of the lung, colon, kidney, ovary and central nervous system. In their result, it was found that α-amyrin exhibited anticancer activity in low potency. Triterpenoids play a vital role as anti-cancer agents and structural modification of this class of compounds can result in the establishment of an innovative drug for the treatment of cancer.48

Antidiabetic activity: Ethanol and aqueous extract of Pergularia daemia plant was investigated against alloxan induced hyperglycemia. 200 mg kg⁻¹ of the extract significantly reduced blood glucose levels to normal which proved hypoglycemic activity. The hypoglycemic activity of P. daemia extract is possibly be due to the presence of β-sitosterol and quercetin. P. daemia on blood glucose level status in streptozotocin induced diabetic rats. The results suggested that oral administration of P. daemia possesses significant antidiabetic potential. It was concluded that antidiabetic effect of P. daemia may due to its bioactive compounds responsible for antidiabetic activity present in the leaves extract.49

Antibacterial activity: The promising antibacterial activity was observed in ethyl acetate and ethanol extracts of Pergularia daemia which showed significant antibacterial activity against S. aureus, P. aeruginosa, A. hydrophila, E. coli and S. typhi. Similarly, have reported that the ethanol extract of P. daemia exhibited antibacterial activity. In addition, recent report also showed the antibacterial activity of Pergularia daemia leaf extract was tested by using various solvents such as hexane, chloroform and ethyl acetate against B. subtilis, S. aureus, E. coli and P. vulgaris.50

Antiirolithiatic Activity: The whole-plant, Pergularia daemia (Family: Asclepediaceae), extract (50% alcohol) was investigated for its antiirolithiatic and diuretic activity. Ethylene glycol (0.75% in water) feeding resulted in hyperoxaluria as well as increased renal excretion of calcium and phosphate. Alcoholic extract (400 mg/kg) of P. daemia was given orally in curative and preventive regimens over a period of 28 days. Supplementation with extract significantly (P < 0.001) lowered the urinary excretion and kidney retention levels of oxalate, calcium and phosphate. Furthermore, high serum levels of urea nitrogen, creatinine and uric acid were significantly (P < 0.001) reduced by the extract. The extract exhibited significant diuretic activity at dose of 400 mg/kg body weight as evidenced by increased total urine volume and the urine concentration of Na⁺ and K⁺. These findings affirm assertions made regarding the effectiveness of the extract of this plant against urinary pathologies in the Indian folk medicine.51

Pharmacognostic and Phytochemical Investigation:- Pharmacognostic and phytochemical studies of stem of Pergularia daemia. Microscopical characters were determined by performing transverse section of stem and powder microscopy. Standardization of whole plant was done with the help of ash value (total ash, acid insoluble ash and water soluble ash), water soluble extractive and alcohol soluble extractive value. Fluorescence analysis was also carried out ultraviolet chamber. Alcoholic and aqueous extracts were prepared and preliminary phytochemical analysis was carried out. Alcoholic extract shows the presence of carbohydrates, alkaloids, flavonoids whereas aqueous extract shows presence of steroids and tannins. Thin layer chromatography of alcoholic extract shows the eight numbers of spot having RfValue 0.12, 0.8, 0.38, 0.45, 0.58, 0.74, 0.87 and 0.93 respectively. Conclusion: Pharmacognostic and phytochemical analysis of powdered stem of Pergularia daemia describing its morphological evaluation, microscopical charaterization, powder analysis, physicochemical evaluation, fluorescence analysis, preliminary phytochemical screening and TLC profiling has been studied in detail so as to develop a reference for academic and commercial purpose. Further, it can be used for the standardization and Pharmacopoeial parameters development.52

Conclusion As seen throughout this review, we have focused on botanical description, ethnomedical uses, Phytochemistry and pharmacological profile of Pergularia daemia. Various phytochemicals such as flavonoid, alkaloid, terpenoid, tannin and steroid have been reported to be present in this plant. The plant also exhibits several pharmacoblogical properties such as antiinflammation, analgesic, antipyretic, antioxidant, anticancer, antihepatic, hepatoprotective, antibacterial, antifungal and central nervous system depressant activity. It is believed that detailed information presented in this review would help the researchers to get aware of this plant and extensive research should be undertaken on P. daemia for establishing new therapeutic drugs for mankind.
