INTRODUCTION

Corona virus is a single-stranded RNA virus with a diameter of about 80–120 nm. It belongs to different genus like α-corona virus, β-corona virus, δ-corona virus and γ – corona virus. SARS-CoV-2 comes under the genus β-corona virus. The emergence of the pandemic COVID-19 has lead to health concern in the public and rapid usage of hand sanitizers is being observed. As it can be effective tool of controlling the infection. Recent studies revealed that the transmission of COVID is possible through the mist and the virus can sustain in such forms for about 9 days. Hence, it is very important to break the conveyance of virus through isolation and by the usage of infection control tools. Effective usage of hand sanitizers and face masks could minimize the spread of the virus. According to the analysis of CDC about 2 million people are getting affected by certain infections acquired through the hospitals per year. Due to danger imposed by this disease, the CDC of the United States has encouraged and promoted the hand sanitizers usage for the sake of maintenance of hand hygiene. The availability of Hand disinfectants are in such forms like Non-alcohol based, alcohol-based, herbal sanitizers.

Hand sanitizer is a crucial step in controlling the infectious virus in the healthcare systems. Numerous hand-sanitation products were accessible outside as they became an emergent rise for the maintenance of hand-hygiene can be seen. Besides regular soaps, hand sanitizers which consists of different chemical agents with effective anti-microbial properties(such as chlorhexidine, iodophors, quaternary ammonium compounds, triclosan) without the use of water or hand drying materials are used rapidly these days. Alcoholic formulations are very effective in various situations. They exterminate various types of pathogens but they are not much efficacious in eradicating the organisms such as Clostridium difficile or Bacillus anthracis. In addition rapid usage of these alcohol-based sanitizers can cause flammability, endoclnal disruptions etc. Moreover the culture of intentional ingestion of alcohol-containing sanitizers has become popular during this pandemic.

This brings out the case of non-alcohol based sanitizers or herbal based sanitizers which is becoming an option. Medicinal plants consist of abundant secondary metabolites, such as tannins, terpenoids, alkaloids and flavonoids, as these are found to possess greater anti-microbial activity. Taking this into consideration, the literature screening was performed for different herbs with the anti-microbial properties and found them (such as Curcuma longa (turmeric), Mentha piperita (peppermint leaves), Eugenia caryophyllus (clove flower buds), and Azadirachta indica.
(neem leaves). Before the discovery of advanced medicine, herbs are the crucial remedy used for various disease treatments. This arrival of different antibiotics; microbes begin to develop resistance to these antibiotics. This brings the researchers towards the herbs those are abundant in microbial activity.

This research is carried out by formulating an herbal sanitizer with the extract of *Curcuma longa*. The ethanolic extract of turmeric has strong anti-microbial properties against the growth of certain microbes such as *Pseudomonas aeruginosa, Bacillus cereus* and *Proteus mirabilis*. It also has good anti-fungal activity against *Trichophyton longifusus*. External application of curcumin was found to decrease variegation and onset of skin tumors.

**MATERIALS AND METHODS:**

**Plant material processing:**

Newly harvested rhizomes of curcumin are collected, deaned and dried under sunlight. The rhizomes after the process of drying were collected and size reduced bypassing through the mesh of suitable size.

**EXTRACTION PROCESS:**

Powdered rhizomes of curcumin were extracted with 95% ethanol through the process of maceration for about 24 hours. The obtained crude extract was filtered, concentrated and collected.

**PRELIMINARY PHYTOCHEMICAL ASSESSMENT OF CRUDE EXTRACT:**

The prepared curcumin extract was assessed for the presence of different phytoconstituents such as carbohydrates, proteins, alkaloids, flavonoids, tannins and saponins using standard preliminary tests.

**CARBOHYDRATES:** The curcumin extract is dissolved in 10ml of purified water, filtered and subjected to the tests for carbohydrates.

**Molisch test:** 2ml of curcumin extract was added into the test tube and few drops of molisch reagent was added to extract. To this 2ml of conc. H₂SO₄ was dropped out from the walls of the test tube. Formation of a violet color ring at the junction of two liquids was observed.

**PROTEINS:** The processed curcumin extract was dissolved in 10ml of water, filtered and test for proteins was carried out.

**Biuret test:** 2ml of filtered solution is treated using a drop of 2% copper sulphate solution. Later on addition of few drops of ethanol (95%). Followed by the addition excess of potassium hydroxide pellets. Pink color formation in ethanolic layer indicates the protein presence.

**ALKALOID:** The solvent free extract of required quantity was added to 3ml of dilute HCl and then filtered. The filtrate was then carried out for the test of alkaloids.

**Mayer’s test:** To 1ml of filtered extract 2 drops of Mayer’s reagent is added from the walls of the test tube. The presence of white or creamy precipitate includes for the alkaloid presence.

**Wagner’s test:** To 1ml of filtrate 2ml of Wagner’s reagent was added from the walls of the test tube. Presence of reddish-brown precipitate confirm positive for the above test.

**Dragendorff’s test:** To the 1ml of filtered extract 2ml of Dragendorff’s reagent is added. Formation of yellow color precipitate confirms were positive test.

**GLYCOSIDES**

**Borntrager’s test:** Prepared curcumin extract was boiled with dilute H₂SO₄ filtered and the addition of chloroform was done and shaken well. The separation of organic layer was observed to which ammonia is added slowly. The appearance of pink or red color in ammonial layer indicates positive for the test.

**TERPENOIDS**

**Salkowski test:** To the extract add 2ml of chloroform and 3ml of concentrated H₂SO₄ was added carefully. A reddish brown color formation indicates presence of terpenoids.

**FLAVONIOIDS:** To the extract 1.5ml of 50% methanol was slowly added. The above solution is warmed and magnesium metal was added unto it. To this, an addition of concentrated sulphuric acid and red color was observed indicating for the presence of flavonoids.

**TANNINS:** To 0.5ml of extract, water and few drops of ferric chloride was added. Presence of blue color indicates for tannins presence.

**SAPONINS:** The processed curcumin extract was shaken with 5ml of water and then heated for boil. Frothing shows up for saponins presence.

**ASSESSMENT OF ISOLATED CURCUMIN BY HIGH PERFORMANCE THIN LAYER CHROMATOGRAPHY**

**EXPERIMENTAL:**

Extraction of the curcuminoind from *Curcuma longa* was carried out with two different solvents and then the isolation of curcumin from the other two components of curcuminoind.

**Preparation of sample:** 0.5gm of *Curcuma longa* was dissolved in 10ml of ethanol, filtered, concentrated and was collected.

**Developing system:** Ethyl acetate: n-hexane 3:7 solvent system was made into use for the development of HPTLC fingerprint profile of terpenoids.

**Sample application:** Test solution of the curcumin extract(2µl) and standard solution of the standard curcuminoind extract (3µl) were filled in Hamilton syringe for 5mm band length on precoated silica gel G aluminum plate 60F 254(E MERCK Germany) (3×10cm) using the applicator connected to AETRON HPTLC system installed and programmed with SPRAYLIN.

**Development of chromatogram:** The developed chromatogram was dried at room temperature and then placed in AETRON document chamber and visualized less than 254nm and image of the chromatogram were obtained with an EoS utility, after quantification was done by using the SPRAYLIN software.

**FORMULATIONS**

**Trail No-1**

Ethanolic extract of *Curcuma longa* was prepared by the process of maceration for about 24hrs. The preparation of gel
base was achieved by the combination of carbopol-940 and HPMC-E15 in water followed by the addition of NaOH and this gel base was transferred into motor and the herbal extract was added along with the other ingredients and transferred into suitable container. The ingredients were listed in the below table (II)

**Trail No-3**

Herbal extract of *Curcuma longa* was prepared using ethanol (95%) as a solvent. Gel base was prepared using the combination of Carbopol-940 and HPMC-E15 at the ration of 4:1. The prepared gel base was neutralized using NaOH (10%) which also acts as a cross linking agent. This gel base was transferred to motor and the herbal extract was added one after the other. The remaining ingredients were added onto the motor and then transferred into clear container.

The ingredients were listed in the below table (II).

### RESULTS AND DISCUSSION:

### PHITOCHEMICAL SCREENING

The phytochemical evaluation of ethanolic extract of *Curcuma longa* results for the existence of secondary metabolites such as carbohydrates, proteins, alkaloids, terpenoids, tannins and flavonoids but the absence of saponins and glycosides. These secondary metabolites serve as competitive weapons against the bacteria, fungi, amoebae and insects.

### HIGH PERFORMANCE THIN LAYER CHROMATOGRAPHY OF ISOLATED CURCUMIN

Linear ascending development to a distance of 80mm using the n-hexane and ethyl acetate as mobile phase was carried out in a twin trough glass chamber formerly saturated with the mobile phase vapour for 20min. Plates were dried in air and photo documented at λ254nm and λ365nm. Results obtained at 365nm were taken out.¹

The turmeric (diferuloylmethane) was a polyphenolic compound consists of the active constituents responsible for the anti-bacterial, anti-fungal, anti-oxidant, anti-proliferative activity such as curcumin, bisdemethoxy curcumin, demethoxycurcumin, curcuminoids etc.

The scan of reference solution revealed the Rf value of 0.68 for the standard and for the test sample it is 0.79. Therefore, the HPTLC evaluation of *C.longa* depicts the presence of the active constituent curcumin in the ethanolic extract of *C.longa*.² The standard reference values for the active constituents of curcumin were provided in the below table-05.

STANDARD CURCUMIN

Plate
Evaluation Parameters:

**Organoleptic properties:** The color, odour and clarity of the formulation were carried out.\(^6\)

**pH:** pH of sanitizer was carried out through pH meter and it was observed that the pH of sanitizer was optimum that is exactly 6.9.

**Skin Irritant test:** Few healthy Volunteers were selected. The formulated curcumin sanitizer was applied on their palm and the time was noted down. Irritancy and itching were checked.\(^11\)

**Evaporation time:** Few healthy Volunteers were selected. The curcumin sanitizer was applied on their palm and the time of evaporation was noted down. All the evaluated parameters were provided in the below table-06

**Evaluation of anti-bacterial activity:** The evaluation of anti-bacterial activity of curcumin gel sanitizer was carried out using different solvents against the strain of aerobic and anaerobic micro-organisms by performing cup-plate method. The nutrient agar medium used for the culture media was provided in the below table-07.

To perform the test, the Petri-plates required for the test must be pre-sterilized to avoid cross-contamination. Petri-plates were pre-sterilized at 160°C in hot air oven. Then, Prepared nutrient agar medium was autoclaved at 121°C for about 30 minutes. Under aseptic conditions culture media was transferred into nutrient agar medium and this entire media is transferred into petri-plate. After, uniform spreading the petriplates were kept aside in until the medium gets solidified.

Then, the plates were taken out and cups or wells were made by using cork borer. Then, the standard 95% ethanolic extract of turmeric and the test sample was added into the cup carefully in aseptic conditions. Then both the plates are incubated for 24hrs at 37°C. After, the incubation period, the zone of inhibition was measured on the Petri plate.

The anti-bacterial evaluation of the formulated curcumin gel sanitizer was found to be safe and effective against the bacterial species such as *E.coli* and *Bacillus subtilis*. As it can be seen that anti-microbial effect of curcumin sanitizer is more efficacious in inhibiting the growth of the microbes as that of the standard i.e ethanolic extract of turmeric. The results were provided in the below table-08.
The above formulation shows effective anti-pathogenic activity as a herbal gel sanitizer.

ACKNOWLEDGEMENT

The authors are grateful to the management of chalapathi institute of pharmaceutical sciences for providing all the necessary facilities for the successful completion of the work.

DISCUSSION

The curcumin gel hand sanitizer was evaluated for its phytochemical screening of active constituents, and also the determination of active constituent of curcuma nothing but curcumin through HPTLC and evaluation of organoleptic properties of the formulated herbal gel sanitizer and checked for the irritancy test and the evaporation time. It was found that the above formulation consist of the lemon yellow colour with the gel consistency and smooth texture. It was also tested for its anti-microbial activity against E.coli and B.subtilis and has shown a significant effect against these microbes. The above formulation consists of the ethnolic herbal extract to minimize the alcohol usage in the formulation of the herbal sanitizer.

CONCLUSION

Hands are the common platform for the pathogenic transmission to the people. The proper maintenance of hand hygiene can protect the health from various contagious pathogens especially for the prevention of COVID-19 transmission. WHO recommended for the usage of alcohol based-sanitizers during this pandemic for the prevention of the disease transmission. But the rapid usage of these alcohol-based sanitizers causing the endocrinal disruptions, flammability and alcohol poisoning if ingested and the intentional ingestion of alcohol containing sanitizers are very efficacious and anti-pathogenic activity as a herbal gel sanitizer.

CONFLICT OF INTEREST

The authors declare no conflict of interest.
