Abstract

Herbal medicine is the oldest form of medicine known to mankind. Cyperus rotundus L. is the world worst weed native to India, which belongs to the family Cyperaceae. It is a smooth, erect, glabrous, grass like, fibrous rooted, perennial herb that grows up to 15–60 cm height, and reproduces widely through rhizomes and tubers. Rhizomes are dark brown and woody, while stems are trigonous, green and smooth. Chemically revealed that, its consist of alkaloids, flavonoids, glycosides, phenols, tannins, steroids, starch and many novel sesquiterpenoids. In Asian countries, the rhizomes of C. rotundus, which are used as traditional folk medicine for the treatment of various ailments like amenorrhea, loss of appetite, colic, constipation, cough, diarrhea, dysentery etc.

Keyword: Cyperus rotundus, weed, rhizomes, traditional folk medicines and Disease

INTRODUCTION

Traditional medicine as defined by WHO refers to the complementary/alternative/non-conventional/indigenous medicine that is developed based on the theories, beliefs and experiences innate to different cultures, whether interpretable or not, used to maintain health, as well as prevent, attenuate or cure physical and mental illnesses1. It is a smooth, erect, glabrous, grass like, fibrous rooted, perennial herb that grows up to 15–60 cm height, and reproduces widely through rhizomes and tubers.

Cyperus rotundus L. known as nagarmotha, saad kuﬁ in unani medicine and nut grass, is considered as one of the world’s worst weeds2. Cyperus rotundus, (family Cyperaceae), also known as purple nutsedge or nutgrass, is a common perennial weed with sender, scaly creeping rhizomes, bulbous at the base and arising singly from the tubers which are about 1-3 cm long. The tubers are externally blackish in colour and reddish white inside, with a characteristic odour. The stems grow to about 25 cm tall and the leaves are linear; dark green and grooved on the upper surface. Inflorescences are small, with 2-4 bracts, consisting of tiny flowers with a red-brown husk. The nut is three angled, oblong-ovate, yellow in colour and black when ripe. Cyperus rotundus is a weed in tropical and warm-temperate countries including India, China, Taiwan, Korea, Philippines, Thailand, Vietnam, Malaysia, Indonesia, the Pacific Islands, Africa, South America, the Middle East, North America, Mexico, New Zealand and Australia3.

C. rotundus revealed the presence of alkaloids, flavonoids, glycosides, phenols, tannins, steroids, starch and many novel sesquiterpenoids. It contain many secondary metabolites such as sesquiterpenes (with diverse skeletons such as patchouliane, rotundane, eudesmane, guaiane, cadinane and caryophyllene types), quinones, flavonoids (visnagin, khellin, ammiol, isorhamnetin, and tricin), saponins, alkaloids, phenolic acids (salicylic acid, protocatechuic acid, caffeic acid and p-coumaric acid), coumarins and steroids (steroideal glycoside, stosteryl(6'-hentriacontanoyl)-6-d-galactopyranoside).

The rhizomes are considered as an analgesic, antihelmintic, antiseptic, antispasmodic, antibacterial, anti-inflammatory, antibacterial, anti-oxygenic and anti-amoebic activity. It is used to treat amenorrhea, loss of appetite, bleeding, blisters, boils, bronchitis, cervical cancer, colic, constipation, cough, diarrhea, dysentery, dysmenorrhea, dyspepsia, dysuria, fever, flatulence, food toxicity, indigestion, infertility, inflammation, insect bites, intestinal parasites, lactic acid disorders, malaria, loss of memory, menstrual disorders, nausea, pyrexia, renal and vesical calculi, rheumatoid arthritis, stomach ailments, excessive thirst, skin rashes, urinary tenesmus, vomiting, worm infestation and wounds.

This research was designed to highlight organoleptic properties & microscopic studies on C. rotundus dried rhizome. All these studies will serve as a reference material in checking the adulteration and identification of authentic drug sample, that use in various compound formulations of Unani System of Medicine.

**Important Formulation:**

**MATERIAL AND METHODS**

**Sample collection, identification and microscopy**

Dried rhizomes of *Cyperus rotundus* were collected from the Pharmacognosy Laboratory, CCRUM – Drug Standardization Research Institute, Ghaziabad. The dried rhizomes were cleaned, coarsely powdered and preserved in air tight container for further studies. Dried whole rhizomes were used to study the external appearance, color, odor and taste. Coarse and fine powders are also prepared to record the organoleptic characters. For powder microscopy, it was treated with chloral hydrate solution followed by staining with saffranin (1%, w/v) for 5-8 min and mounted in glycerine (60%, v/v). The slide was observed under light microscope and characters of identification were recorded.

## RESULTS AND DISCUSSION

**Organoleptic Characteristics of *Cyperus rotundus* L.**

**Macroscopic identification**

Rhizomes of *Cyperus rotundus* are bluntly conical with number of wiry and tough slender roots, often attached to one another by a thin and tough connective. Each rhizome is tumicate, varies in size and thickness, crowned with remains of stem and leaves forming a hairy to scaly covering. The rhizome length is 1.5 to 3.0 cm, whereas diameter is 0.8 to 1.6 cm. Its stolons are elongated upto 1.5 to 3.5 cm long. Surface of the rhizome is dark brown or black in color, whereas internal structure is light brown; odor- fragrant, taste- slightly pungent (Fig. 1 A). Coarse and fine powders are coffee brown in color, slightly pungent in taste, odor fragrant (Fig. 1 B & C).

**Powder microscopy**

Color of powder is brown; shows reddish brown cells, spiral and simple pitted vessel cells; fiber like, closely packed sclerified cells, narrow tracheid with pitted thickness and thick walled rounded to elongated parenchyma with brown content of tannin or pale oleo-resin, fragment of endodermis with pitted wall in surface view; round, oval to elongated starch grains and few rosette crystals of calcium oxalate (Fig. 2 A-I).

CONCLUSION

Herbal medicine is the oldest form of medicine known to mankind. It was the mainstay of many early civilizations and still the most widely practiced form of medicine in the world today.

*Cyperus rotundus* popularly called “the world’s worst weed” is widely distributed in subtropical and tropical regions of the world. It is a perennial plant and this plant is mentioned in the ancient Unani literature.

There are many compound formulations having Saad koofi as an important ingredient in their powdered form. Identification of authentic material in those formulations is highly essential in order to maximize their efficacy and minimize the adverse side effect. In this regard literature review, macroscopy and microscopic studies are one of the simplest and cheapest methods to establish the correct identity of the Unani drugs material.

Acknowledgement

The authors would like to record their gratitude to Dr. Noor Zaheer Ahmed, Director General, CCRUM, New Delhi, for providing an research environment to work with excellence and meticulousness.

Conflict of Interest: No conflict of interest.

Author Contribution: Reesha Ahmed conceived the idea and designed the manuscript. Anees Ahmad compiled the data and analysis of botanical identification of plant used. Asma Sattar Khan done the physic-chemical analysis of plant used in the current manuscript. Mohammed Wasim Ahmed edited the paper critically.
